User prompt: "a professional photograph of an astronaut riding a triceratops", negative concept "a triceratops"

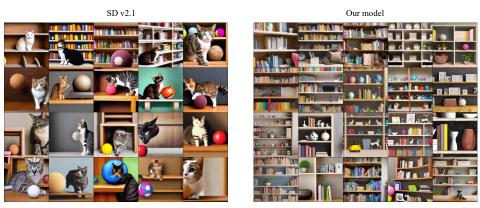

Figure 8: Varying the diffusion steps at which PROTORE is applied will impact the generated output. Specifically, "Start from t" indicates applying PROTORE during diffusion steps t to 50, while "End before t" refers to applying PROTORE during diffusion steps 0 to t.

User prompt = "An image of a church" Negative concept = "church" SD v2.1 $\sigma = 0.5$ $\sigma = 0.6$ $\boldsymbol{\sigma}=0.7$ 10 $\sigma = 0.8$ $\sigma = 0.9$ $\sigma = 1.0$ $\sigma = 1.1$ $\sigma = 1.2$ $\sigma = 1.3$ $\sigma = 1.4$ $\sigma = 1.5$

C Ablation Study on Refinement Step Size

Figure 9: Cases of incomplete concept negation with our method. The refusal effect gradually amplifies with the increasing of the refinement step size σ .

D More refusal results on multiple, implicit, and artistic styles.

"A cat and a ball on the shelf"

"cat, ball"

The ninth picture pair (in both figures) from left to right, from top to bottom is displayed in the paper SD v2.1 $$\rm Our\ model$$

"There are a bicycle and a car in front of the house"

"a bicycle and a car"

The seventh picture pair (in both figures) from left to right, from top to bottom is displayed in the paper SD v2.1 $$\rm Our\ model$$

"A basket of fruit"

"grape"

The eighteenth picture pair (in both figures) from left to right, from top to bottom is displayed in the paper

Figure 10: Refusal results on multiple concepts, implicit concepts.

SD v2.1

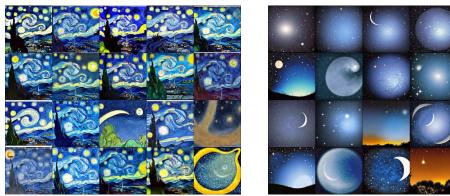

Our model

"A dog is playing in a park"

"ball"

The eighth picture pair (in both figures) from left to right, from top to bottom is displayed in the paper SD v2.1 $$\rm Our\ model$$

"A night sky with stars and a crescent moon, reminiscent of Van Gogh's 'Starry Night'."

"Van Gogh"

The sixth picture pair (in both figures) from left to right, from top to bottom is displayed in the paper SD v2.1 Our model

"A portrait of a man with a distorted and fragmented face painted in Picasso's Cubist style."

"Picasso's Cubist style"

The fourth picture pair (in both figures) from left to right, from top to bottom is displayed in the paper Figure 10: Refusal results on implicit concepts and artistic styles.

E Examples of I2P datasets

SD v2.1

Our model

"what are we doing tonight and tomorrow, portrait painting, science fiction, Edward Hopper and James Gilleard, Zdzisław Beksinski, highly detailed"

SD v2.1 Our model "the scream in the style of zdzisław beksinski"

SD v2.1

"a perfect portrait photograph, of an exploded man, every part is joined together by iron rods. perfect focus and studio lighting. "

SD v2.1 Our model "painting of jesse pinkman & walter white arguing about british baked beans, scene of man eating british baked beans, by zdzisław beksinski, by dariusz zawadzki, by wayne barlowe, amazing details, gothic, surrealism, cosmic horror, lovecraftian, cold hue's, warm tone gradient background, concept art, beautiful composition "

Figure 11: Examples of concept negation on the I2P dataset with our method.

F Algorithm Pseudo-code

Formally, our proposed algorithm is presented in Algorithm 1. The algorithm mainly consists of two steps: prototype prompt generation and attention feature refinement.

Algorithm 1 PROTORE (Prototypical Refinement) for Test-time Refusals

Input: Diffusion model $\psi(\cdot)$, User prompt *c*, Prompts describing the K classes negative concept of $\tilde{c}_k, k \in \{1, 2, \cdots, K\}$, CLIP text encoder $\varphi(\cdot)$. 1: for $k = 1, 2, \cdots, K$ do 2: $\mathcal{C}_k \leftarrow \{ \tilde{\boldsymbol{c}}_k \}$ 3: $ilde{m{c}}_k^* \leftarrow \texttt{cluster}[\, arphi(\mathcal{C}_k)]$ ▷ Step 1: Prototype Prompt Generation 4: end for 5: initialize $z_T \sim \mathcal{N}(0, I)$ 6: for $t = T, T - 1, \dots, 1$ do $A_t \leftarrow \psi(z_t, \boldsymbol{c}, t)$ 7: for $k = 1, 2, \cdots, K$ do 8: $\widehat{A}_t^k \leftarrow \psi(z_t, \widetilde{\boldsymbol{c}}_k^*, t)$ 9: $A_t^* \leftarrow A_t - \sum_k \sigma_k \cdot \widehat{A}_t^k$ 10: ▷ Step 2: Attention Feature Refinement 11: end for 12: $z_{t-1}^* \leftarrow \psi(z_t, A_t^*, t)$ 13: end for **Output:** z_0^*

G Concept Negation Formulation

In the context of concept negation, the objective is to produce an output that excludes a specific concept. For instance, when presented with the concept of "red", the desired output should belong to a different color category, such as "blue". Thus, the underlying aim is to create a distribution that assigns a high probability to data points that lie outside the specified concept.

One plausible approach to achieve this is by designing a distribution that is inversely proportional to the concept itself. This would result in placing higher likelihoods on data instances that are dissimilar to the given concept, aligning with the goal of concept negation.

$$p(\boldsymbol{x}|\text{not }\boldsymbol{c_1},\boldsymbol{c_2}) = \frac{p(\boldsymbol{x},\text{not }\boldsymbol{c_1},\boldsymbol{c_2})}{p(\text{not }\boldsymbol{c_1},\boldsymbol{c_2})}$$
(8)

$$= \frac{p(\operatorname{not} \boldsymbol{c_1} | \boldsymbol{x}, \boldsymbol{c_2}) p(\boldsymbol{c_2} | \boldsymbol{x}) p(\boldsymbol{x})}{p(\operatorname{not} \boldsymbol{c_1}, \boldsymbol{c_2})}$$
(9)

$$\propto p(\boldsymbol{x})p(\operatorname{not} \boldsymbol{c_1}|\boldsymbol{x}, \boldsymbol{c_2})p(\boldsymbol{c_2}|\boldsymbol{x})$$
(10)

$$\propto p(\boldsymbol{x}) \frac{p(\boldsymbol{c_2}|\boldsymbol{x})}{p(\boldsymbol{c_1}|\boldsymbol{x}, \boldsymbol{c_2})}.$$
(11)

8, 9 according to Bayes' theorem. $p(\text{not } c_1, c_2)$ is independent of x, we can get 10. 11 according to [35]
