

Bayesian binning beats approximate alternatives: estimating peri-stimulus time histograms.

Poster ID W13

D. Endres, M. Oram, J. Schindelin and P. Földiák

The alternatives
Ours

Objective: model *instantaneous firing rates* from *neural spike trains* as a function of time.

Fixed boundary histogram approach
(Shimazaki & Shinomoto, *Neu. Comp.*, 2007)

Spike density function by smoothing spike trains with a Gaussian kernel.

Bayesian binning for peri-stimulus time histogram (PSTH): iterates over *all* possible binnings.

- Computes *Bayesian expectations*
- Yields *error bars* on predictions
- Provides *complexity control* via model comparison,
- *Only* cubic effort for *exact inference* !!
- *Better predictor* of *real neural data* than alternative approaches above.
