## A Uniform-transfer $\alpha$ -IDS games: lemmas

Under the uniform-transfer  $\alpha$ -IDS games, the overall safety function, given a joint mixed-strategy  $\mathbf{x} \in [0, 1]^n$ , is  $s(\mathbf{x}) = \prod_{i=1}^n [1 - (1 - x_i)\delta_i]$ . Now, we can determine the best response of a SC (or SS) player exactly based solely on the value of  $\Delta_i^{sc}(1 - (1 - a_i)\delta_i)$  (or  $\Delta_i^{ss}(1 - (1 - a_i)\delta_i)$ ) relative to  $s(\mathbf{x})$ .

In the following, we assume, without loss of generality, that for all players  $i$ ,  $R_i > 0$ ,  $\delta_i > 0$ ,  $p_i > 0$ , and  $\alpha_i > 0$ . Given a joint mixed-strategy  $\mathbf{x}$ , we partition the players by type w.r.t.  $\mathbf{x}$ : let  $I \equiv I(\mathbf{x}) \equiv \{i \mid x_i = 1\}$ ,  $N \equiv N(\mathbf{x}) \equiv \{i \mid x_i = 0\}$ , and  $P \equiv P(\mathbf{x}) \equiv \{i \mid 0 < x_i < 1\}$  be the set of players that fully invest in protection, do not invest in protection, and partially invest in protection, respectively.

### A.1 Uniform-transfer SC $\alpha$ -IDS games

**Lemma 1 (Ordering Lemma)** *Suppose  $\mathbf{x}$  is a NE of a uniform-transfer SC  $\alpha$ -IDS game. Then for any  $i \in I$  (investing players), any  $j \in P$  (partially investing players), and any  $k \in N$  (not investing players), then*

$$\begin{aligned}
 \Delta_i^{sc} &\leq \Delta_j^{sc} \\
 \Delta_i^{sc} &\leq (1 - \delta_k)\Delta_k^{sc} < \Delta_k^{sc} \\
 (1 - \delta_j)\Delta_j^{sc} &\leq (1 - \delta_k)\Delta_k^{sc}
 \end{aligned}$$

**Proof** The inequalities follow immediately by using the overall safety function to compare the players in  $I$ ,  $P$ , and  $N$ .  $\square$

The following Lemma specifies the strategies of the players in the partially investing set.

**Lemma 2 (Partial Investment Lemma)** *Suppose  $\mathbf{x}$  is a NE of a uniform-transfer SC  $\alpha$ -IDS game. For any  $j \in P$ ,*

1. *If  $|P| = 1$ , then  $x_j \in \frac{1}{\delta}(\frac{1}{\Delta_j^{sc}}V - (1 - \delta_j))$*
2. *if  $|P| > 1$ , then  $x_j = \frac{1}{\delta}(\frac{1}{\Delta_j^{sc}}V^* - (1 - \delta_j))$*

where  $V = [\max_{i \in I} \Delta_i^{sc}, \min_{k \in N} (1 - \delta_k)\Delta_k^{sc}]$  and  $V^* = \left( \frac{\prod_{j \in P} \Delta_j^{sc}}{\prod_{k \in N} (1 - \delta_k)} \right)^{\frac{1}{|P|-1}}$ .

**Proof** Suppose that  $|P| = 1$ . By the best-response condition  $\Delta_j^{sc} = \prod_{l \in N} (1 - \delta_l)$ . Moreover

$$\forall i \in I, \Delta_i^{sc} \leq (1 - (1 - x_j)\delta_j) \prod_{l \in N} (1 - \delta_l)$$

and

$$\forall k \in N, (1 - \delta_k) \Delta_k^{sc} \geq (1 - (1 - x_j) \delta_j) \prod_{l \in N} (1 - \delta_l).$$

If we solve for  $x_j$ , we can obtain the values that  $x_j$  can take at an equilibrium.

Suppose that  $|P| > 1$ . By the best-response condition

$$\Delta_j^{sc} = \prod_{p \in P - \{j\}} (1 - (1 - x_p) \delta_p) \prod_{l \in N} (1 - \delta_l) \quad \forall j \in P.$$

Furthermore, for  $j \in P$ ,

$$\prod_{k \in P - j} \Delta_k^{sc} = (1 - (1 - x_j) \delta_j)^{|P| - 1} (\prod_{p \in P - j} (1 - (1 - x_p) \delta_p))^{|P| - 2} (\prod_{l \in N} (1 - \delta_l))^{|P| - 1}$$

It follows that

$$\begin{aligned} \frac{\prod_{k \in P - j} \Delta_k^{sc}}{(\prod_{p \in P - j} (1 - (1 - x_p) \delta_p))^{|P| - 2} (\prod_{l \in N} (1 - \delta_l))^{|P| - 1}} &= (1 - (1 - x_j) \delta_j)^{|P| - 1} \\ \frac{\prod_{k \in P} \Delta_k^{sc}}{(\prod_{p \in P - j} (1 - (1 - x_p) \delta_p))^{|P| - 1} (\prod_{l \in N} (1 - \delta_l))^{|P|}} &= (1 - (1 - x_j) \delta_j)^{|P| - 1} \\ \left( \frac{\prod_{k \in P} \Delta_k^{sc}}{(\prod_{p \in P - j} (1 - (1 - x_p) \delta_p))^{|P| - 1} (\prod_{l \in N} (1 - \delta_l))^{|P|}} \right)^{\frac{1}{|P| - 1}} &= (1 - (1 - x_j) \delta_j) \\ \left( \frac{\prod_{k \in P} \Delta_k^{sc}}{\prod_{l \in N} (1 - \delta_l)} \right)^{\frac{1}{|P| - 1}} \frac{1}{(\prod_{p \in P - j} (1 - (1 - x_p) \delta_p)) \prod_{l \in N} (1 - \delta_l)} &= (1 - (1 - x_j) \delta_j) \\ \left( \frac{\prod_{k \in P} \Delta_k^{sc}}{\prod_{l \in N} (1 - \delta_l)} \right)^{\frac{1}{|P| - 1}} \frac{1}{\Delta_j^{sc}} &= (1 - (1 - x_j) \delta_j) \end{aligned}$$

The result follows from solving for  $x_j$ . □

## A.2 Uniform-transfer SS $\alpha$ -IDS games

**Lemma 3** (*Partial Investment Lemma*) Suppose  $x$  is a NE of a uniform-transfer SS  $\alpha$ -IDS game. For any  $j \in P$ ,

1. If  $|P| = 1$ , then  $x_j \in \frac{1}{\delta} (\frac{1}{\Delta_j^{ss}} V - (1 - \delta_j))$
2. if  $|P| > 1$ , then use Lemma 2 part 2.

where  $V = [\max_{k \in N} (1 - \delta_k) \Delta_k^{ss}, \min_{i \in I} \Delta_i^{ss}]$ .

**Proof** The proof is similar to the one in Lemma 2. □

## B Pseudocode for computing all NE in uniform-transfer $\alpha$ -IDS games

This section contains the pseudocode of the algorithms described in the main body of the paper. In particular, Algorithm 1 and Algorithm 2 are algorithms to compute all NE in uniform-transfer SC  $\alpha$ -IDS games and uniform-transfer SS  $\alpha$ -IDS games, respectively. The subroutine **TestNash** of Algorithm 1 is outlined in Algorithm 3. The subroutine **TestNash** of Algorithm 2 can be constructed similarly from Algorithm 3 where it will use Lemma 3.

The running time of Algorithm 1 and Algorithm 2 is  $O(n_{sc}^3)$  and  $O(n_{ss}^3)$ , respectively, where the **TestNash** subroutine takes  $O(n)$ , and line 7 of the algorithms runs in  $O(n(1 + 2 + \dots + n)) = O(n^3)$  times for  $n = n_{sc}$  or  $n = n_{ss}$ .

---

**Algorithm 1:** Compute all Nash equilibria of SC  $\alpha$ -IDS games

---

**Input** : An instance of  $n$ -players SC  $\alpha$ -IDS Game**Output:**  $S$  - The set of all Nash equilibria of the input game

```
1  $I \leftarrow \{1, \dots, n\}, P \leftarrow \{\}, N \leftarrow \{\}$ 
2  $S \leftarrow \text{TestNash}(I, P, N)$ 
3 Order  $(i_1, i_2, \dots, i_n)$  such that  $\Delta_{i_1}^{sc} \geq \dots \geq \Delta_{i_n}^{sc}$ 
4 foreach  $k = 1, \dots, n$  do
5    $P \leftarrow P \cup \{i_k\}, I \leftarrow I - \{i_k\}, N \leftarrow \{\}, S \leftarrow S \cup \text{TestNash}(I, P, N)$ 
6   Let  $P' \leftarrow P$  and order  $(j_1, \dots, j_k)$  such that  $(1 - \delta_{j_1})\Delta_{j_1}^{sc} \geq \dots \geq (1 - \delta_{j_k})\Delta_{j_k}^{sc}$ 
7   foreach  $m = 1, \dots, k$  do
8      $N \leftarrow N \cup \{j_m\}, P' \leftarrow P' - \{j_m\} S \leftarrow S \cup \text{TestNash}(I, P', N)$ 
9   end foreach
10 end foreach
11 return  $S$ 
```

---

---

**Algorithm 2:** Compute All Nash Equilibrium of SS consistent with Ordering 1

---

**Input** : An instance of  $n$ -players SS  $\alpha$ -IDS Game**Output:**  $S$  - A set of all Nash Equilibrium that is consistent with Ordering 1

```
1  $I \leftarrow \{\}, P \leftarrow \{\}, N \leftarrow \{1, \dots, n\}$ 
2  $S \leftarrow \text{TestNash}(I, P, N, S)$ 
3 Order  $(i_1, i_2, \dots, i_n)$  such that  $(1 - \delta_{i_1})\Delta_{i_1}^{ss} \geq \dots \geq (1 - \delta_{i_n})\Delta_{i_n}^{ss}$ 
4 foreach  $k = 1, \dots, n$  do
5    $P \leftarrow P \cup \{i_k\}, N \leftarrow N - \{i_k\}, I \leftarrow \{\}, S \leftarrow \text{TestNash}(I, P, N, S)$ 
6   Let  $P' \leftarrow P$  and order  $(j_1, \dots, j_k)$  such that  $\Delta_{j_1}^{ss} \geq \dots \geq \Delta_{j_k}^{ss}$ 
7   foreach  $m = 1, \dots, k$  do
8      $I \leftarrow I \cup \{j_m\}, P' \leftarrow P' - \{j_m\} S \leftarrow \text{TestNash}(I, P', N, S)$ 
9   end foreach
10 end foreach
11 return  $S$ 
```

---

---

**Algorithm 3:** TestNash subroutine

---

**Input** : A partition of the players into  $I, P,$  and  $N$ **Output:**  $S$  - The set of all Nash equilibria consistent with the input partition

```
1  $\forall i \in I, x_i \leftarrow 0, \forall k \in N, x_k \leftarrow 0$ 
2 if  $|P| = 1$  and  $j \in P$  (Lemma 2 Part 1) then
3   Let  $U' = U \cap (0, 1)$ 
4   if  $\Delta_j^{sc} = \prod_{k \in N} (1 - \delta_k)$  and  $U' \neq \emptyset$  then
5      $S \leftarrow \{\mathbf{y} \mid y_j \in U', \mathbf{y}_{-j} = \mathbf{x}_{-j}\}$ 
6   end if
7 else Lemma 2 Part 2
8    $\forall j \in P,$  compute  $x_j$ 
9   if  $\mathbf{x}$  is an MSNE of the input game then
10     $S \leftarrow \{\mathbf{x}\}$ 
11  end if
12 end if
13 return  $S$ 
```

---

## C Computing all MSNE of arbitrary $\alpha$ -IDS games

### C.1 Proof sketch of Theorem 6

In the following, we will show that determining whether there exists a PSNE consistent with a partial-assignment of the actions to some players is NP-complete, even if the transfer probability takes only two values:  $\delta_i \in \{0, q\}$  for  $q \in (0, 1)$ .

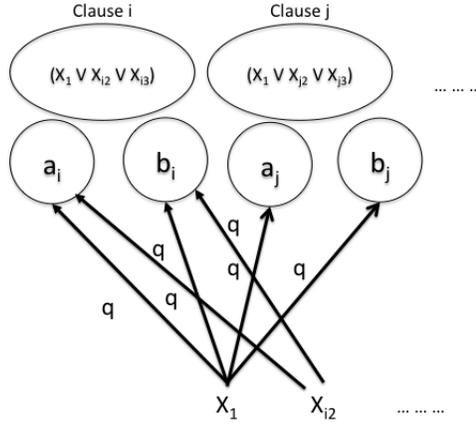

Figure 1: 3-SAT-induced  $\alpha$ -IDS game graph

More specifically, this section contains proof to show that the pure-Nash extension problem for  $n$ -player SC  $\alpha$ -IDS and  $n$ -player SS  $\alpha$ -IDS games are NP-complete.

The *pure-Nash-extension problem* [1] for binary-action  $n$ -player games that takes as input a description of the game and a *partial* assignment  $\mathbf{a} \in \{0, 1, *\}^n$ . We want to know whether there is a *complete* assignment  $\mathbf{b} \in \{0, 1\}^n$  consistent with  $\mathbf{a}$ .

**Theorem 1** (*Theorem 6 of the Main Paper*) *The pure-Nash extension problem for  $n$ -player SC  $\alpha$ -IDS games is NP-complete.*

**Proof** (Sketch) We reduce from Monotone 1 in 3-SAT [2]. The big idea is to consider a bipartite graph structure (Figure C.2) between the clauses and the variables (all direct edges from variables to the corresponding clause players with transfer probability  $q > 0$ ). We introduce two players ( $a_i$  and  $b_i$ ) for each clause  $i$ . Player  $a_i$  invests if at least one of its variable players invest. Player  $b_i$  invests if at least two of its variable players invest. For clause players  $a_i$  and  $b_i$ , we find  $R_j > 0$  and  $\alpha_j > 1 - p_j$  for  $j \in \{a_i, b_i\}$  such that  $(1 - q)^2 > \Delta_{a_i}^{sc} > (1 - q)^3$  and  $(1 - q) > \Delta_{b_i}^{sc} > (1 - q)^2$ , respectively. The variable players would be indifferent between invest and not invest. For each variable player  $i$ , we just need to make sure that  $\Delta_i^{sc} = 1$  (or  $R_i = p_i$ ). Finally, we give partial assignments to the clauses player where  $a_i$  invests and  $b_i$  not invest to guarantee that exactly one invests and solution to Monotone 1 in 3-SAT.  $\square$

## C.2 Proof sketch of Theorem 7

**Theorem 2** (*Theorem 7 of the Main Paper*) *The pure-Nash extension problem for  $n$ -player SS  $\alpha$ -IDS games is NP-complete.*

**Proof** (Sketch) This is similar to the proof of Theorem 6 except the best-response of the players and using the game graph as in Figure C.2. For each clause  $i$ , we introduce two clauses players  $a_i$  and  $b_i$ . Player  $a_i$  invests if at least two of its variable players do not invest. Player  $b_i$  invests if at least three (or all three) of its variable players do not invest. Mainly, find  $R_j > 0$  and  $\alpha_j < 1 - p_j$  for  $j \in \{a_i, b_i\}$  such that  $(1 - q) > \Delta_{a_i}^{ss} > (1 - q)^2$  and  $(1 - q)^2 > \Delta_{b_i}^{ss} > (1 - q)^3$ . The variable players would be indifferent between invest and not invest. We give partial assignment to the clauses player where  $a_i$  invests and  $b_i$  not invest to guarantee that exactly one invests.  $\square$

## D On real-world graph dataset used for the experiments

Table 1 shows the exact number of nodes and edges for each of the graphs from the real-world datasets we used for our experiments.

Table 1: Exact number of nodes and edges for different real-world graphs

Graph	Nodes	Edges
Karate Club	34	78
Les Miserables	77	254
College Football	115	613
