## Abstract

1 AI models are increasingly prevalent in high-stakes environments, necessitating  
2 thorough assessment of their capabilities and risks. Benchmarks are popular for  
3 measuring these attributes and for comparing model performance, tracking progress,  
4 and identifying weaknesses in foundation and non-foundation models. They can  
5 inform model selection for downstream tasks and influence policy initiatives.  
6 However, not all benchmarks are the same: their quality depends on their design  
7 and usability. In this paper, we develop an assessment framework considering 46  
8 best practices across an AI benchmark’s lifecycle and evaluate 24 AI benchmarks  
9 against it. We find that there exist large quality differences and that commonly used  
10 benchmarks suffer from significant issues. We further find that most benchmarks  
11 do not report statistical significance of their results nor allow for their results to be  
12 easily replicated. To support benchmark developers in aligning with best practices,  
13 we provide a checklist for minimum quality assurance based on our assessment. We  
14 also develop a living repository of benchmark assessments to support benchmark  
15 comparability, accessible at [betterbench.stanford.edu](https://betterbench.stanford.edu).

## 16 1 Introduction

17 AI systems are rapidly advancing and proliferating [58]. The increasing integration of AI, and in  
18 particular foundation models (FMs) [14], into decision-making systems has significantly amplified  
19 its impact and has showcased both benefits [9, 39, 57, 66] and risks [2, 75, 44, 86, 45, 30, 70]. Given  
20 the importance of correctly assessing a model’s capabilities and potential harms, AI evaluation is  
21 an essential discipline [15]. Current evaluation approaches include both internally (e.g., private  
22 testing on proprietary data) and externally developed techniques (e.g., scoring on public benchmarks)  
23 [74, 27, 73, 48, 32].

24 Following the work of [67], we define a benchmark “as a particular combination of a dataset or sets  
25 of datasets [...], and a metric, conceptualized as representing one or more specific tasks or sets of  
26 abilities, picked up by a community of researchers as a shared framework for the comparison of  
27 methods” [67]. Using benchmarks to facilitate comparison, measure performance, track progress, and  
28 identify weaknesses has become a standard practice. For example, benchmarks are widely used by  
29 model developers to report performance and compare models upon release [3, 8], and as part of policy  
30 initiatives to support third-party model evaluations, such as as part of the UK AI Safety Institute’s

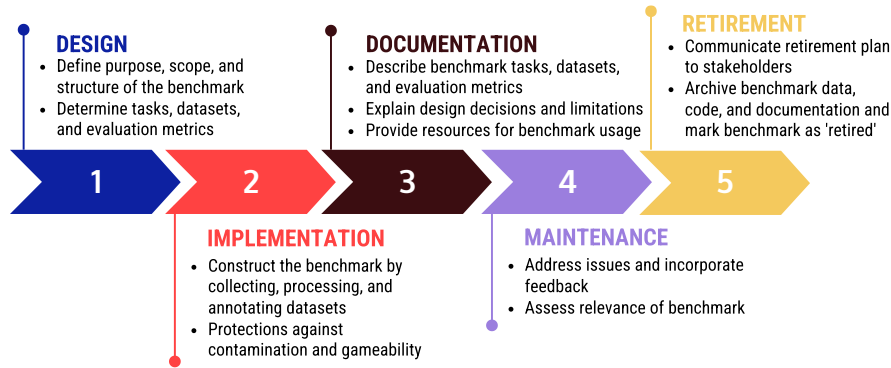

Figure 1: Five stages of the benchmark lifecycle. A detailed description can be found in App. C.

31 *Inspect* framework for evaluating large language models (LLMs) [81] or Article 51 of the EU AI  
 32 Act [1]. However, the fidelity of this approach depends entirely on the benchmarks’ quality, where  
 33 we define a *high-quality* benchmark as one that is interpretable, clear about its intended purpose  
 34 and scope, and that is usable. To date, no structured assessment for the quality of AI benchmarks,  
 35 including both FM and non-FM benchmarks, has been published, and no comparative analysis has  
 36 been conducted to understand quality differences between widely used AI benchmarks. To address  
 37 these gaps, our paper:

- 38 • Presents a novel AI benchmark assessment framework evaluating the quality of AI bench-  
 39 marks based on 46 criteria derived from expert interviews and domain literature
- 40 • Scores 16 foundation model (FM) and 8 non-FM benchmarks (full list in App. D), finding  
 41 quality differences across both categories
- 42 • Provides insights into prevalent issues in current AI benchmarking practices based on our  
 43 assessment
- 44 • Creates a checklist for minimum quality assurance to support benchmark developers in  
 45 aligning with best practices
- 46 • Makes available a living repository<sup>2</sup> of benchmark assessments for users to analyze bench-  
 47 marks’ quality and appropriateness for their usage contexts.

48 We structure the paper as follows: Sec. 2 explores benchmarking in AI and other fields. Sec. 3  
 49 describes our assessment development, which combined literature and expert interviews, and details  
 50 our benchmark scoring procedure. Sec. 4 presents our framework’s criteria, focusing on aspects  
 51 under developers’ control to promote better benchmarks. Sec. 5 lists additional context-dependent  
 52 design considerations. Sec. 6 reports findings from applying our framework to 24 benchmarks.  
 53 Finally, Sec. 7 and Sec. 8 explore implications for future evaluations and discuss our work’s scope  
 54 and limitations. We further outline open challenges with AI benchmarking in App. A, involved  
 55 stakeholders in App. B, and the AI benchmark lifecycle in App. C.

## 56 2 Related Work

### 57 2.1 AI Benchmarking Practices and Challenges

58 Our literature review of AI benchmarking practices identifies two primary concerns: what a bench-  
 59 mark measures and how this measurement is used. Regarding what a benchmark measures, [59]  
 60 find that current benchmarks for LLMs are insufficient for assessing these models capabilities. A  
 61 frequent concern in this context is the validity of evaluations [54, 76, 67]. Similarly, [62] finds

<sup>2</sup><https://betterbench.stanford.edu>

62 that the rapid advancement of AI models threatens benchmarks’ utility, as a large fraction of these  
63 evaluations are near saturation. [83] and [49] both address the narrow scope of existing benchmarks,  
64 with [49] advocating for approaches intended to reduce the socio-technical gap that exists between  
65 the capabilities that benchmarks are able to measure and the ability of models to meet user needs  
66 in downstream applications. With respect to how evaluations are used, [67] critiques the tendency  
67 of AI practitioners to overgeneralize benchmark results, highlighting how these scores present an  
68 inherently reductive view of model performance.

69 In addition, the community has also recognized the importance of data curation and documentation  
70 in the context of evaluations. [65] put forth the idea of data cards as standardized documentation  
71 framework for datasets and [12] develop a framework and checklist for best practices in data curation.  
72 Finally, the FAIR principles [87] outline best practices for digital data access, based on the principles  
73 of *Findability*, *Accessibility*, *Interoperability*, and *Reuse*. While these efforts support the adoption  
74 of best practices in the context of data, they are insufficient for assessing AI benchmarks, which  
75 extend data with infrastructure and evaluation methods, requiring additional guidelines to support the  
76 development of high-quality benchmarks and the decision-making of benchmark users.

77 Hence, our work builds on and expands these guidelines, with the aim of advancing the analysis of  
78 AI benchmarking by presenting a first-of-its-kind framework for the assessment of both foundation  
79 model and non-foundation model benchmarks. Unlike prior studies, such as [59] and [49], which  
80 focus on identifying limitations in limited contexts and scopes, our approach offers practical tools,  
81 empowering developers to address shortcomings and directly enhance benchmark quality: Our  
82 assessment spans a wider range of criteria across the benchmark lifecycle, from design (e.g., have  
83 domain experts been involved in the development?) to implementation (e.g., is the evaluation script  
84 available?), documentation (e.g., is the applicable license specified?), and maintenance (e.g., is a  
85 feedback channel available for users?). We give an overview of all our criteria in Sec. 4 and explain,  
86 justify, and provide scoring details for each criterion in App. K. We further provide a checklist of best  
87 practices derived from our analysis (App. J), offering guidance for improving AI benchmarks, rather  
88 than merely highlighting issues.

## 89 2.2 Benchmarking Best Practices in Other Fields

90 Our work is informed by benchmarking practices from fields beyond AI, ranging from transistor  
91 hardware [18] to environmental quality [16] to bioinformatics [7], and we identify common themes  
92 regarding what constitutes an effective benchmark. Where applicable, we incorporate these best  
93 practices into our assessment (Sec. 4):

94 **Designing for downstream utility.** Many of the papers reviewed discuss the importance of a  
95 benchmark’s tasks being designed with real world applications in mind. [16] considers the best  
96 benchmarks to be situation-specific, [24] defines an ideal test set as one which reflects real world data,  
97 [7] proposes that benchmarks should be adapted to their intended applications, and [25] suggests  
98 that benchmarks be designed to fit the diversity of downstream use cases. [77] emphasizes the  
99 importance of guaranteeing that tested methods only use information available in a practical setting  
100 and recommends checking that a benchmark simulates the envisioned usage.

101 **Ensuring validity.** A frequent concern with benchmarking is the validity of evaluations [54, 76, 67].  
102 In educational testing, [60] outline a framework to ensure validity by providing guidelines for effective  
103 evidence collection. [22] outline what and how evidence can be collected and how it should be  
104 interpreted for tests “of attributes for which there is no adequate criterion” [22]. Measures that are  
105 used in other fields further include choosing a large test set to promote the statistical significance of  
106 results [77] and updating a benchmark over time to prevent developers from overfitting it [7]. [7] also  
107 notes that the methods or approaches being evaluated should not be used to create the gold standard  
108 dataset.

109 **Prioritizing score interpretability.** [7] highlights that benchmarks are particularly important when  
110 a wide variety of tools are available and it is difficult for non-specialists to distinguish between  
111 them. Interpretability is important in not only selecting tools, but also deciding between benchmarks

112 themselves. Effective benchmarks must provide transparent information regarding the procedural  
113 details of their experiments [18] and goals of the evaluation [10]. They should clearly describe the  
114 benchmark’s purpose and scope, as these are fundamental to its design and implementation [85].  
115 Regarding scope, [16] states that for environmental quality applications, benchmarks should never be  
116 the basis of final decisions. With this in mind, they identify misleading benchmarks as the worst-case  
117 scenario. Furthermore, they state that a benchmark should not present its results as absolutes, instead  
118 ensuring that its evaluations are understandable inputs for decision makers [16].

119 **Guaranteeing accessibility.** A good benchmark is easy to obtain and use [7, 77, 25, 10]. If a  
120 benchmark is run computationally, then its data and scripts must be available for results to be  
121 reproducible [77, 25, 10].

### 122 3 Methodology

123 Our benchmark assessment consists of 46 criteria based on our literature review and interviews  
124 with five primary groups of stakeholders. These groups, who also present the user personas of our  
125 assessment, are described in detail in App. B. Through our interview process, we defined a five-stage  
126 benchmark lifecycle and identified objectives along it. In this section, we discuss our methodology  
127 for identifying stakeholders, developing criteria, and assessing benchmarks. A detailed flow diagram  
128 of our methodology can be found in App. H.

129 **Step 1: Mapping the space.** Initially, we surveyed the existing benchmark landscape (Sec. 2).  
130 Based on this review, we identified five stakeholder groups who present the user personas of our  
131 assessment (App. B). To understand their objectives with respect to benchmarking, we conducted  
132 unstructured interviews with representatives of all stakeholder groups, including 20+ policymakers,  
133 model developers, benchmark developers, model users, and AI researchers. During this process, we  
134 developed a five-stage model of the benchmark lifecycle (Fig. 5 and App. C) and mapped both the  
135 benchmarking objectives of the stakeholders and their communicated use cases for a benchmark  
136 assessment (App. B).

137 **Step 2: Translation to criteria.** Based on Step 1, we identified tasks and objectives for each stage  
138 of the AI benchmark lifecycle and translated them into concrete criteria. We categorized these  
139 as: (a) criteria controlled by the benchmark developer where the authors and interviewees reached  
140 a normative consensus, (b) criteria controlled by the benchmark developer but context-dependent,  
141 difficult for an external party to assess, or both and (c) aspects either outside the benchmark developer’s  
142 control or requiring further research. The assessment in Sec. 4 is limited to category (a) criteria. We  
143 cover considerations in (b) in Sec. 5, and those in (c) in App. A.

144 **Step 3: Validating the assessment.** Initially, three authors independently scored the same benchmark  
145 to calibrate the assessment and identify potential misinterpretations of the criteria. We adapted and  
146 clarified scoring guidelines (App. K) to address differing interpretations and uncertainties. To validate  
147 our assessment, we shared it with members of all stakeholder groups and revised it based on their  
148 feedback. Finally, we verified that our assessment, which in itself can be considered a benchmark,  
149 met all of our defined criteria, where applicable (App. J.2).

150 **Step 4: Structuring the assessment.** We evaluated 16 FM and 8 non-FM benchmarks. We prioritized  
151 commonly used benchmarks, such as those that were recently reported by model developers [8, 3]  
152 and aim to expand the number of assessed benchmarks continuously on our website *betterbench.stan-*  
153 *ford.edu*. Since our assessment considers varying information sources (official websites, papers,  
154 GitHub repositories published by the benchmark developers<sup>3</sup>) that do not follow a standard structure,  
155 we manually evaluated all benchmarks. At least two authors independently reviewed each benchmark.  
156 They subsequently had to reach a consensus on the final score and a third reviewer could be called to  
157 make the final decision if a consensus could not be reached (this case did not occur).

---

<sup>3</sup>We do not consider third-party information that was not released by the benchmark developers themselves.

158 **Step 5: Scoring.** We scored benchmarks on a discrete 0/5/10/15-point scale for each criterion: 15  
 159 for fully meeting, 10 for partially meeting, 5 for mentioning without fulfilling, and 0 for neither  
 160 referencing nor satisfying the criterion. Average scores were calculated for each benchmark lifecycle  
 161 stage (design, implementation, documentation, and maintenance). An aggregate usability score,  
 162 representing the weighted average of the implementation, documentation, and maintenance scores,  
 163 was also introduced (see App. G for scoring details). We consider a mean score of 10 or higher to  
 164 indicate a reasonably good benchmark for each aggregated scoring category, as it signifies that, on  
 165 average, the benchmark at least partially fulfills all assessment criteria within the respective category.

166 **Step 6: Platform for continuous updates.** Finally, we develop a supplementary website<sup>4</sup> to  
 167 continuously publish assessment results using the scoring methodology in App. G, given the rapid  
 168 development of new AI benchmarks. The website includes a community feedback channel for  
 169 submitting new AI benchmarks and correcting previously posted scores if benchmarks are updated  
 170 or stakeholders disagree with our evaluation. This provides benchmark users with an accessible,  
 171 up-to-date database of existing benchmarks and their quality, enabling quick analysis of the most  
 172 suitable benchmark for their application context.

## 173 4 Assessment Criteria

174 We separate our assessment criteria according to the phase of the benchmark lifecycle during which  
 175 they would be fulfilled. Although the retirement stage is within the developer’s control, we do  
 176 not include specific criteria for this phase within the current framework, because we cannot assess  
 177 the retirement of active benchmarks. App. K contains full explanations, justifications, and scoring  
 178 guidelines for each of the 46 criteria.

### 179 4.1 Benchmark Design

Design Criteria	
1. Tested capability, characteristic, or concept is defined	9. How benchmark score should or shouldn't be interpreted or used is described
2. How tested capability or concept translates to benchmark task is described	10. How knowing about the tested concept is helpful in the real world is described
3. Domain experts are involved	11. Informed performance metric choice
4. Domain literature is integrated	12. Metric floors and ceilings are included
5. Use cases or user personas are described	13. Human performance level is included
6. Differences to related benchmarks are explained	14. Random performance level is included
7. Input sensitivity is addressed	
8. Has validated automatic evaluation	

Figure 2: Overview of assessment criteria for the benchmark design stage.

180 Benchmarks should clearly describe their goals and scope [85, 10, 54]. This includes defining the  
 181 tested capability or characteristic, describing how the tested capability translates to the benchmark  
 182 task, and stating how knowing about the tested concept is helpful in real-world applications [54].  
 183 These design choices should be informed by considering use cases and user personas for the bench-  
 184 mark, involving domain experts, and integrating domain literature [82]. Clearly stating how the  
 185 benchmark is different from related existing AI benchmarks is necessary to help benchmark users  
 186 decide the applicability of a benchmark to their use case. A benchmark’s measurements must be  
 187 interpretable [16], which requires an informed choice of performance metric(s) and a description of  
 188 how the benchmark score should or shouldn’t be interpreted [48]. Including floors, ceilings, human  
 189 performance levels, and random performance levels for the chosen metric(s) further assists users  
 190 in understanding a model’s score [34]. If addressing input sensitivity and providing a validated  
 191 automatic evaluation are possible, these measures enhance a benchmark’s robustness and accessibility  
 192 [34].

<sup>4</sup>betterbench.stanford.edu. Our assessment and results are released under a CC BY 4.0 license.

193 **4.2 Benchmark Implementation**

Implementation Criteria	
1. Evaluation code is available	7. Script to replicate results is explicitly included
2. Evaluation data or generation mechanism is accessible	8. Statistical significance or uncertainty quantification of benchmark results is reported
3. Evaluation of models via API is supported	9. Need for warnings for sensitive/harmful content is assessed
4. Evaluation of local models is supported	10. Build status is implemented
5. Globally unique identifier or encryption of evaluation instances is added	11. Release requirements are specified
6. Task to identify if model has been trained on benchmark data is included	

Figure 3: Overview of assessment criteria for the benchmark implementation stage.

194 Criteria in the implementation stage focus on the availability of necessary code and infrastructure  
195 and the inclusion of key engineering features. To ensure reproducibility and scrutiny [77, 25, 10],  
196 a benchmark should provide working evaluation code, and make its evaluation data, prompts, or  
197 dynamic test environment accessible. A script should be available to replicate initial published  
198 results. In domains where models are often accessed via API, such as NLP, an ideal benchmark  
199 supports the evaluation of both API-based and local models. A benchmark can minimize the risks of  
200 contamination and gamification by including a globally unique identifier or encrypting evaluation  
201 instances. This is especially important for testing models that rely on web-scraped training data.  
202 Including a *training\_on\_test\_set* task allows determining whether a model’s training data included  
203 benchmark examples [74]. As an additional measure, specifying clear release requirements informs  
204 users how to preserve the integrity of test results [6].

205 **4.3 Benchmark Documentation**

Documentation Criteria	
1. Requirements file available or equivalent is available	11. Globally unique, persistent identifier for a dataset and its metadata is provided
2. Quick-start guide or demo is available	12. Standardized metadata is included
3. In-line code comments are used	13. Data sources and data collection process are explained
4. Code documentation is available	14. Data preprocessing steps are described (if applicable)
5. Accompanying paper is accepted at peer-reviewed venue	15. Data annotation process is described (if applicable)
6. Benchmark design process is documented	16. Evaluation metric is documented
7. Test tasks & rationale are documented	17. Applicable license is specified
8. Assumptions of normative properties are documented	18. Data representativeness is explained (if applicable)
9. Limitations are documented	19. Data is documented using a standardized format.
10. Test environment design or prompt design process is documented	

Figure 4: Overview of assessment criteria for the benchmark documentation stage.

206 Providing comprehensive and accessible documentation is crucial for the practicability and interpreta-  
207 tion of benchmarks [18]. Key information about a benchmark should be readily available and include  
208 documentation of benchmark construction processes [54], data collection [87] or test environment  
209 design, and its test tasks and their rationale [54]. Clearly documenting evaluation metric(s) and  
210 reporting the statistical significance of results is necessary so that users can understand a benchmark’s  
211 actual signal [4]. To provide context and prevent misinterpretation, developers should document  
212 normative assumptions about benchmark properties and discuss the limitations of their benchmark.  
213 A benchmark’s codebase should contain a requirements file, a quick-start guide or demo code, a  
214 description of code file structure and contents, and in-line comments within all relevant files. Having  
215 a benchmark’s paper accepted at a peer-reviewed venue signals external scrutiny and adherence to  
216 certain standards. Lastly, developers should specify the applicable license to provide legal clarity and  
217 enable, e.g., commercial use.

## 218 4.4 Benchmark Maintenance

Maintenance Criteria	
1. Code usability was checked within the last year	3. Contact person is listed
2. Maintained feedback channel for users is available	

Figure 5: Overview of assessment criteria for the benchmark maintenance stage.

219 An optimally designed, implemented, and documented benchmark will cease to be useful if it is not  
220 maintained. Developers should regularly check code usability and maintain a feedback channel for  
221 users to report issues or suggest improvements. Providing contact details of a person responsible for  
222 the benchmark facilitates communication and support. Alternatively, if a benchmark is not maintained  
223 anymore, authors should include a corresponding statement indicating that the benchmark was retired  
224 in any official benchmark artefacts.

## 225 5 Other Design Considerations

226 This section presents design considerations for benchmark developers that were excluded from our  
227 assessment because their appropriateness is context-dependent, they are not easily verifiable, or both.  
228 Our aim with this list is to promote conscious design decisions regarding these considerations.

229 **General vs. specific benchmarks.** Benchmark developers must decide whether to prioritize general  
230 or abstract knowledge and skills or specific contexts and domains. Broad concept benchmarks may  
231 contribute to understanding foundational characteristics of models, but often face challenges in  
232 real-world applicability and reliable testing (see App. A).

233 **Detecting small improvements.** Benchmarks should be designed so that a 1% improvement can be  
234 reliably detected [34]. As [34] states, “the more difficult it is to detect small amounts of progress,  
235 the more difficult it becomes to make iterative progress on a benchmark.” Practically, this is likely  
236 dependent on evaluation data size and task diversity.

237 **Multi-modal assessment.** As multi-modal models become increasingly common, benchmark de-  
238 velopers may want to consider designing tasks to assess the capabilities they want to test across  
239 modalities. Additional design considerations for multi-modal assessments include the increased  
240 complexity of mapping a tested concept to different modalities and the different output formats of the  
241 tested models [91].

242 **Versioning.** Minor updates (e.g., removing faulty prompts) should be clearly indicated via *task*  
243 *versioning* [13]. Major updates require releasing new *benchmark versions*, as exemplified by the  
244 AgentBench v0.1 and v0.2 releases [52].

245 **Dynamic vs. static benchmarks.** Dynamic benchmarks may better address quick saturation (App. A)  
246 and contamination (App. A) issues but reduce result comparability and are easier to implement for  
247 some tasks (e.g., adding numbers) than others. Static benchmarks, on the other hand, tend to suffer  
248 from the issues outlined above.

249 **Gameability.** An ideal benchmark is resilient to attempts to boost task performance without im-  
250 proving the fundamental capability being tested [7]. Existing benchmarks have been shown to be  
251 vulnerable to manipulation [6]. Specific guidelines have been proposed to prevent cheating and  
252 ensure evaluations reflect genuine model performance [94].

253 **Positionality statement.** Positionality statements<sup>5</sup> are a reflective account common in social sciences  
254 research. In them, researchers acknowledge how their background, experiences, and biases may have  
255 influenced their work. If developers believe such factors significantly impacted their benchmark’s  
256 construction, they may provide a positionality statement for increased context and transparency.

<sup>5</sup>Such statements were not included in the assessment to avoid pressuring benchmark developers to disclose potentially sensitive personal information, even if such information influenced the benchmark design process.

Figure 6: Average and individual scores of all assessed benchmarks per lifecycle stage.

Stage	FM	Non-FM	All
<b>Design</b>	10.6	11.1	10.7
<b>Implementation</b>	5.5	7.4	6.1
<b>Documentation</b>	10.3	9.9	10.1
<b>Maintenance</b>	9.1	10.8	9.7

Table 1: Benchmark lifecycle scores averaged over the 24 assessed benchmarks separated for FM, non-FM, and All benchmarks combined.

	FM	Non-FM	All
<b>Pearson <math>\rho</math></b>	0.721	0.318	0.655
<b>p-value <math>p</math></b>	0.001	0.487	0.001

Table 2: Pearson correlation coefficient for FM, Non-FM, and All benchmarks between the design and usability (weighted average of implementation, documentation, and maintenance stages) score as in Fig. 7.

## 257 6 Quantitative Results

258 In this section, we present our assessment results.<sup>6</sup> Tab. 1 showcases the average scores per benchmark  
 259 lifecycle stage, showing that for both FM and non-FM benchmarks, the implementation stage tends  
 260 to be the weakest area, followed by maintenance. All criteria averages are reported in App. F. Some  
 261 criteria have not been fulfilled by almost any benchmark (e.g., *Standardized metadata is included*).  
 262 Notably, both benchmark types are particularly weak for criteria supporting the reproducibility and  
 263 interpretation of results: benchmarks get an average score of 3.75 on *Including a script to replicate*  
 264 *results* and an average score of 5.62 on *Reporting statistical significance*.

265 While individual benchmark or criteria scores are deterministic, we can analyze statistical fluctuations  
 266 across categories and benchmarks. Fig. 7 compares the design and usability scores of FM and non-  
 267 FM benchmarks. The overall average design score across all benchmarks is 10.7, and the weighted  
 268 average usability score is 8.7. The difference in mean design and usability scores between FM and  
 269 non-FM benchmarks is not statistically significant (95% confidence level), see Fig. 8 in App. E.  
 270 Furthermore, we find statistically significant correlations between the design and usability scores  
 271 for FM benchmarks alone and all benchmarks combined at the 95% confidence level (Tab. 2). This  
 272 suggests that, in both cases, benchmarks with poorer design tend to also be less usable, and vice  
 273 versa.

## 274 7 Discussion

275 **Not all benchmarks are of the same quality.** Model developers frequently report performance  
 276 on benchmarks that vary significantly in quality. For instance, the widely-used MMLU benchmark  
 277 scored the lowest in our assessment (weighted average: 5.5), while GPQA scored significantly higher  
 278 (weighted average: 11.0). However, recent communications introducing models like GPT-4 [3],  
 279 Claude-3 [8], and Gemini [80] report results on both benchmarks without explicitly acknowledging  
 280 their limitations or quality differences. This practice may be driven by the assumed expectation that  
 281 reviewers want to see a wide range of metrics and the belief that readers should determine the most  
 282 relevant metrics for their needs. The lack of clear guidance on AI benchmark quality and limitations  
 283 may lead to incorrect conclusions about a model’s performance, even if developers do not intend to

<sup>6</sup>Per-criterion scores for all benchmarks are released on our website [betterbench.stanford.edu](https://betterbench.stanford.edu). Code to replicate results will be available on GitHub upon publication.

Figure 7: Design and usability score for all 24 assessed benchmarks. The usability score is the weighted average of the implementation, documentation, and maintenance scores. Benchmarks were split into foundation model and non-foundation model benchmarks, depending on the model group they’re targeting.

284 mislead users. The UK AI Safety Institute’s *Inspect* framework [81] similarly includes both MMLU  
 285 [33] and GPQA [68], potentially resulting in misleading evaluations. This is problematic because  
 286 governments increasingly rely on evaluations for AI regulations and may use frameworks like *Inspect*  
 287 [69] or individual benchmarks [1].

288 **Most benchmarks fail to distinguish signal and noise.** Benchmark developers should not only  
 289 report a single result for a model but also re-run their evaluation [13] with, e.g., different random  
 290 seeds or sampling temperatures, and report the mean and variance for these intra-model evaluations.  
 291 As benchmarks are primarily used to compare models, users must know the intra-model variance of a  
 292 benchmark to determine whether observed inter-model variances are genuine performance differences  
 293 or arise from noisy results. If intra-model variance bounds are tight and inter-model variance bounds  
 294 are wide, benchmark users can conclude that there are genuine performance differences between  
 295 models. However, if both intra- and inter-variance bounds are wide, statistical analysis is required to  
 296 discern noise and actual signal. Yet, 14 out of 24 benchmarks did not perform multiple evaluations of  
 297 the same model or report statistical significance or uncertainty of results.

298 **Insufficient implementation limits reproducibility and scrutiny of benchmarks.** Our analysis  
 299 reveals that scores for implementation stage criteria are the lowest across all assessed benchmarks.  
 300 Notably, 17 out of 24 benchmarks do not provide easy-to-run scripts to replicate the results reported  
 301 in the initial paper, and 4 out of 24 only provide scripts to replicate part of the results. This lack of  
 302 accessibility hinders reproducibility and limits users’ ability to scrutinize the benchmarking process.  
 303 In a field where reproducibility is a significant concern [43], providing materials to reproduce results  
 304 is crucial for validating benchmark findings.

305 **Small changes can lead to significant improvements in overall benchmark practices.** Many of  
 306 the criteria we have identified for improving AI benchmarks are relatively easy to implement, even  
 307 for existing benchmarks. For example, adding code documentation and a point of contact are not  
 308 time consuming to add, yet can significantly enhance usability, accountability, and ease of use.

309 **Necessity for higher benchmark development standards.** As evidenced by the strong discrepancies  
 310 in AI benchmark quality we found (Sec. 6 and App. F), there is a need to introduce additional checks  
 311 for benchmarking practices to ensure a minimum quality standard for AI benchmarks. We assume that  
 312 benchmark developers do not intentionally construct insufficient benchmarks, but rather do so due to  
 313 limited knowledge of what constitutes a good benchmark. By providing a checklist of best practices  
 314 (App. J.1), we aim to make it easy for benchmark developers to adopt these recommendations and

315 improve the quality of their benchmarks. In addition, some of the criteria we have identified in our  
316 expert interviews and from reviewing evaluation practices in other fields, such as including a build  
317 status in GitHub repositories that assesses whether the last commit successfully passed defined unit  
318 tests [28], were relatively unknown and only implemented by 3 out of 24 benchmarks. Other criteria,  
319 like using globally unique identifiers or encrypting evaluation instances to avoid data contamination,  
320 have been pioneered by only a few of the assessed benchmarks [68, 74] but have not yet gained  
321 widespread adoption. By incorporating these criteria into our assessment, we aim to encourage  
322 benchmark developers to adopt these best practices in the field of AI benchmarking.

## 323 **8 Limitations**

324 Our assessment assigns equal weight to all criteria, despite their varying levels of effort required for  
325 fulfillment and differing contributions to overall benchmark quality. The scoring system differentiates  
326 only four score categories to enable relatively objective evaluation through clear-cut criteria (App. K  
327 and App. G), but may miss nuances within each category. For example, a benchmark barely fulfilling  
328 a criterion and one almost entirely fulfilling it would receive the same 10-point score. Given the  
329 equal weighting and scoring, benchmark developers could potentially “game” the assessment by  
330 focusing on easily fulfilled criteria. However, we believe that even if a developer only implements  
331 easy-to-implement criteria, the resulting benchmark will still be of higher quality than one not  
332 meeting any criteria, thus fulfilling our work’s goal. Furthermore, assessing the construct validity of  
333 a benchmark and determining whether its approach to assessing a concept is truly effective would  
334 presumably require in-depth analysis by domain experts in the respective fields, which is beyond  
335 the scope of this assessment. Instead, we aim to provide benchmark developers with a blueprint for  
336 minimum quality assurances. Finally, our framework is intended for public benchmarks and future  
337 work is needed to extend it to private ones.

## 338 **9 Impact Statement**

339 By releasing the first systematic assessment framework for AI benchmarks, we aim to encourage  
340 benchmark developers to construct higher-quality benchmarks and to contribute to community efforts  
341 to make AI evaluations more practicable and transparent. Higher-quality benchmarks resulting  
342 from the adoption of our framework and checklist can lead to better-informed model selection for  
343 downstream tasks, potentially reducing risks and improving outcomes in high-stakes applications.  
344 Our living repository of benchmark assessments promotes transparency and comparability, allowing  
345 benchmark users to make informed decisions when choosing benchmarks. However, there is a  
346 potential risk of misinterpretation of our results; our assessment only provides minimum quality  
347 assurances and is not sufficient to assess the suitability of a benchmark for a concrete use case.  
348 The outputs of our evaluation do not contain sensitive or harmful content, but users may encounter  
349 such content during a benchmark assessment depending on the benchmark’s data. While we do not  
350 anticipate direct safety risks from releasing our framework, we acknowledge that strict adherence to  
351 some of our proposed criteria, such as the involvement of domain experts, may unequally impact  
352 researchers based on their access to resources and connections, potentially hindering the development  
353 of benchmarks from a broader range of research institutions and underrepresented communities,  
354 which could limit diversity in benchmark creation.

## 688 **NeurIPS Checklist**

689 The checklist follows the references. Please read the checklist guidelines carefully for information on  
 690 how to answer these questions. For each question, change the default **[TODO]** to **[Yes]**, **[No]**, or  
 691 **[N/A]**. You are strongly encouraged to include a **justification to your answer**, either by referencing  
 692 the appropriate section of your paper or providing a brief inline description. For example:

- 693 • Did you include the license to the code and datasets? **[Yes]** See Section ??.
- 694 • Did you include the license to the code and datasets? **[No]** The code and the data are  
 695 proprietary.
- 696 • Did you include the license to the code and datasets? **[N/A]**

697 Please do not modify the questions and only use the provided macros for your answers. Note that the  
 698 Checklist section does not count towards the page limit. In your paper, please delete this instructions  
 699 block and only keep the Checklist section heading above along with the questions/answers below.

### 700 1. For all authors...

- 701 (a) Do the main claims made in the abstract and introduction accurately reflect the paper’s  
 702 contributions and scope? **[Yes]** *We support all our claims in Sec. 1 in Sec. 6 and*  
 703 *App. F.*
- 704 (b) Did you describe the limitations of your work? **[Yes]** *Limitations are described in*  
 705 *Sec. 8 and Sec. 9.*
- 706 (c) Did you discuss any potential negative societal impacts of your work? **[Yes]** *The*  
 707 *broader impact of our work, including negative implications, is discussed in Sec. 9.*
- 708 (d) Have you read the ethics review guidelines and ensured that your paper conforms to  
 709 them? **[Yes]** *We conform to all points in the ethics review. For example, we do not*  
 710 *work with PII or otherwise sensitive information and any potential negative impacts of*  
 711 *our assessment were discussed in Sec. 9.*

### 712 2. If you are including theoretical results...

- 713 (a) Did you state the full set of assumptions of all theoretical results? **[N/A]** *Our work*  
 714 *does not involve theoretical results.*
- 715 (b) Did you include complete proofs of all theoretical results? **[N/A]** *Our work does not*  
 716 *involve theoretical results.*

### 717 3. If you ran experiments (e.g. for benchmarks)...

- 718 (a) Did you include the code, data, and instructions needed to reproduce the main experi-  
 719 mental results (either in the supplemental material or as a URL)? **[Yes]** *The code to*  
 720 *replicate results will be added as supplementary material and published as part of a*  
 721 *GitHub repo upon publication.*
- 722 (b) Did you specify all the training details (e.g., data splits, hyperparameters, how they  
 723 were chosen)? **[N/A]** *We’re not training a model and hence do not include training*  
 724 *details. However, we provide all necessary information to replicate the results in our*  
 725 *paper as part of the supplementary material.*

- 726 (c) Did you report error bars (e.g., with respect to the random seed after running experi-  
727 ments multiple times)? [Yes] *We report statistical significance results for our results,*  
728 *where applicable. See Section 6 and Appendix F.*
- 729 (d) Did you include the total amount of compute and the type of resources used (e.g., type  
730 of GPUs, internal cluster, or cloud provider)? [N/A] *We did not train or modify a*  
731 *model and hence did not use significant compute resources beyond standard laptops.*
- 732 4. If you are using existing assets (e.g., code, data, models) or curating/releasing new assets...
- 733 (a) If your work uses existing assets, did you cite the creators? [Yes] *We assess existing*  
734 *benchmarks and cite their creators where we mention them.*
- 735 (b) Did you mention the license of the assets? [Yes] *Given that we do not use, distribute*  
736 *or modify the benchmarks we assess, we did not mention their license information. We*  
737 *release our assessment and results under the CC BY 4.0 license (Sec. 3).*
- 738 (c) Did you include any new assets either in the supplemental material or as a URL? [Yes]  
739 *We provide all assessment results as part of this paper in App. F. They will be included*  
740 *as part of a repository of benchmark assessments on our website that we will release*  
741 *separately to preserve anonymity.*
- 742 (d) Did you discuss whether and how consent was obtained from people whose data you're  
743 using/curating? [N/A] *We did not use people's personal data. We base our assessment*  
744 *on publicly available information by the respective benchmark developers.*
- 745 (e) Did you discuss whether the data you are using/curating contains personally identifiable  
746 information or offensive content? [N/A] *We do not use any PII data and we mentioned*  
747 *in the paper that our content is not offensive.*
- 748 5. If you used crowdsourcing or conducted research with human subjects...
- 749 (a) Did you include the full text of instructions given to participants and screenshots, if  
750 applicable? [N/A] *We only conducted information-gathering, unstructured interviews*  
751 *without explicit instructions to interviewees. There were no formal instructions. How-*  
752 *ever, we did show the assessment criteria to interviewees at some point during each*  
753 *unstructured interview and asked for their feedback.*
- 754 (b) Did you describe any potential participant risks, with links to Institutional Review  
755 Board (IRB) approvals, if applicable? [N/A] *We only conducted information-gathering*  
756 *interviews, which do not fall under the category of research with human subjects and*  
757 *hence do need an IRB approval.*
- 758 (c) Did you include the estimated hourly wage paid to participants and the total amount  
759 spent on participant compensation? [N/A] *The interviews we conducted were only*  
760 *done with voluntary participants that were not compensated.*

## 761 **A Open Challenges in AI Benchmarking**

762 Per the current state of the field, some benchmark issues are not fully addressable by benchmark  
763 developer actions and decisions. This section discusses these issues and directs readers, where  
764 possible, to resources which cover these open problems in greater depth.

765 **Quick saturation.** Rapid advancements in AI have led to the saturation of many benchmarks. Some  
766 benchmarks have been saturated within months of their release [58]. Addressing this issue involves  
767 evaluating current model performances and assessing whether the concept has already been solved,  
768 and determining if the benchmark can be made challenging given state-of-the-art capabilities of the  
769 models tested.

770 **Contamination.** In Sec. 4.2, we discuss strategies to mitigate data contamination. However, even  
771 when fully adhered to, challenges remain. For example, benchmark developers cannot enforce model  
772 developers’ use of canary strings to avoid training on benchmark data. Preventing data contamination,  
773 particularly in models reliant on large amounts of web-scraped data, is a shared responsibility between  
774 benchmark and model developers. [90] offers further description of measures that can be taken on  
775 the model developer side. This issue is pressing, as contamination has been demonstrated in both FM  
776 [29, 37, 47] and non-FM [43, 41]. Future work across stakeholders is needed to effectively mitigate  
777 contamination and preserve benchmark validity.

778 **Poor construct validity.** Construct validity refers to the degree to which a test or measurement  
779 tool accurately measures the construct it intends to measure [22]. [61] outline factors which make  
780 construct validity, especially in FM benchmarking, a challenge. They describe certain properties  
781 (e.g. factual accuracy) that arise from the interaction between the model and its user population,  
782 rather than from the model alone. To combat this, they suggest incorporating ecologically valid<sup>7</sup> user  
783 interactions into the assessment; yet, given the lack of transparency by model developers into actual  
784 user interactions, this criteria is difficult to implement for benchmark developers. Alternately, [23]  
785 propose that guarantees be made through formal verification, although this approach has not yet been  
786 tested in practice.

787 **Standardization of benchmark reporting.** Due to the difficulties with construct validity, most  
788 benchmarks cannot provide an absolute signal and instead give a relative one by comparison of models  
789 on the same benchmark. This signal is often unavailable to potential model users, as there is no  
790 present standardization of benchmark reporting. Model developers report whichever benchmarks they  
791 see fit without being obligated to provide a rationale, resulting in inconsistent reporting, especially  
792 apparent in the case of benchmarks relating to responsible AI concepts [58]. While this issue does  
793 not depend on further research, there is no consensus in theory or practice regarding how benchmark  
794 reporting should be standardized. Potential avenues towards standardization include publication of  
795 benchmark results through independent entities, market incentives such as government contracts, and  
796 mandatory reporting as part of AI legislation.

## 797 **B Stakeholders**

798 This section details the stakeholders that are involved in benchmark development and use processes.

799 **Benchmark developers.** Benchmark developers are the individuals or teams who create bench-  
800 marks from scratch (e.g. BIG-Bench [74]), by expanding on previously developed benchmarks  
801 (e.g. MedMNIST v2 [89]), by integrating multiple existing benchmarks (e.g. HELM [48]), or by  
802 both expanding upon and integrating other benchmarks (e.g. Decoding Trust [84]). This groups  
803 objectives are developing benchmarks that accurately and comprehensively assess models capabilities  
804 or safety-critical characteristics and establishing standards for AI system evaluations that facilitate  
805 comparisons and drive progress on the specified tasks. There are three use cases for benchmark  
806 developers of our assessment, checklist, and website:

---

<sup>7</sup>Ecological validity is the extent to which the findings of a research study are able to be generalized to real-life settings [46]

- 807 • They use the checklist to understand best practices and guide their benchmark construction  
808 process pre-deployment.
- 809 • They use the assessment to score their benchmark after constructing it to understand any  
810 shortcomings they may address to improve the overall benchmark quality.
- 811 • They can use the website to find related benchmarks and compare their benchmark quality  
812 to those.

813 **Model developers.** Model developers are the individuals or teams who develop AI models for  
814 commercial use (e.g. GPT-4 [3]) or non-commercial purposes (e.g. Alpaca [79]). Their objectives in  
815 using benchmarks are demonstrating the performance of their models identifying areas for improve-  
816 ment which can guide model development and to establish credibility and encourage adoption by  
817 showcasing favorable relative performance. There are three use case for model developers of our  
818 assessment and website:

- 819 • They can use the assessment results to decide which benchmarks to report
- 820 • Model developers can reference our assessment results in their official reporting to indicate  
821 quality differences between benchmarks, if applicable
- 822 • Model developers can use our website to find relevant benchmarks to report for their model

823 **Model users.** Model users are the individuals, organizations, or businesses which use or modify  
824 available AI models for various downstream applications (e.g. a company using ChatGPT to provide  
825 customer service). Their objective when using benchmark results is making informed decisions  
826 regarding which AI models are most suitable for their specific use cases. There are two use case for  
827 model users of our assessment and website:

- 828 • If model developers dont reference our or any similar benchmark quality assessment, model  
829 users can refer to our assessment results on the website to understand quality differences in  
830 benchmarks reported by model developers.
- 831 • They can also refer to our benchmark assessment results to decide between two related  
832 benchmarks who's results may both be relevant for the model user's application context. If  
833 one of these benchmarks has a higher quality, they may decide to prioritize that result based  
834 on our assessment.

835 **AI researchers.** AI researchers are individuals or teams studying AI and related fields either at  
836 non-profits, within academic institutions, in industry, or independently. One of researchers objectives  
837 is using benchmarks to evaluate the performance of novel AI architectures, training techniques, and  
838 approaches, and to compare these to other systems. Additionally, they have the objective of setting  
839 research agendas based on the model limitations and weaknesses revealed by benchmarks. There are  
840 two use case for AI researchers of our assessment and website:

- 841 • Based on our website and assessment results, AI researchers may analyze benchmarking  
842 practices in more detail to understand challenges of benchmark developers and drive research  
843 on open questions in AI evaluations and AI benchmarking more broadly.
- 844 • They can use our website to understand the overall AI benchmark landscape.

845 **Regulators and standard-setting organizations.** Regulators and standard-setting organizations  
846 may be affiliated with government agencies, international bodies, and industry associations. In these  
847 roles, they are responsible for creating and enforcing standards and regulations for AI development  
848 and use. Examples of such entities are the AI Safety Institutes, the ISO, and the EU Commission.  
849 The objective of these stakeholders is using benchmarks to assess the compliance of AI models with  
850 established regulations, guidelines and standards for traits such as performance, fairness, and safety.  
851 For example, the UK AI Safety Institute recently released their *Inspect* evaluation framework [81]  
852 that includes several benchmarks that we scored in our assessment, among other evaluation strategies.  
853 There are two use case for model users of our assessment and website:

- 854 • Regulators and standard-setting organizations can refer to our checklist to design regula-  
855 tory requirements, e.g., by only accepting benchmarks as proof for compliance by model  
856 developers that completed certain or all criteria in our checklist
- 857 • They can also mandate that only benchmarks that achieved a certain score on our assessment  
858 may be used to proof compliance with regulatory requirements.

## 859 C Benchmark Lifecycle

860 **Design.** During the design stage, a benchmarks purpose, scope, and structure are defined. This  
861 requires developers to identify key aspects of an AI system that the benchmark will assess. Based on  
862 this decision, they must determine the tasks, datasets, and evaluation metrics which will be used in  
863 their benchmark. To inform these decisions, developers consider the requirements of potential users,  
864 possibly collaborating with and gathering feedback from these and other stakeholders.

865 **Implementation.** At this stage, the benchmark is constructed and all necessary components are  
866 aggregated. Developers collect, process, and (if applicable) annotate the datasets to be used for their  
867 tasks. They then create the evaluation scripts which allow models performance on this data to be  
868 measured. So that new models can be evaluated, developers may implement user interfaces and APIs  
869 which enable access to and interaction with the benchmark. This stage concludes with the initial  
870 testing and validation of benchmark components.

871 **Documentation.** To facilitate the benchmarks use and interpretation, benchmark developers need  
872 to create comprehensive documentation. This includes preparing detailed descriptions of benchmark  
873 tasks, datasets, and evaluation metrics. Additionally, developers may provide instructions for how to  
874 access, use, and submit to the benchmark. Documenting design decisions, limitations, and potential  
875 biases enables stakeholders to make informed decisions regarding benchmark use. Creating resources  
876 for running the benchmark, such as quick-start guides, code documentation, and examples or tutorials  
877 is an essential step for accessibility.

878 **Maintenance.** Once the benchmark and its documentation are released, developers must conduct  
879 regular maintenance to ensure ongoing usability. They may monitor benchmark usage and perfor-  
880 mance to identify areas for improvement and track users compliance with release requirements. Other  
881 tasks at this stage include addressing issues or bugs and incorporating user feedback into updates.  
882 Developers can regularly update documentation and support materials. Additionally, they can assess  
883 the continued relevance and utility of the benchmark by monitoring performance on the benchmark  
884 and responding to community feedback.

885 **Retirement.** The final phase of a benchmarks lifecycle is retirement. Benchmarks are phased out  
886 or replaced when they become saturated (i.e. model performance reaches the benchmark metrics  
887 ceiling), the task studied loses relevance, or better alternatives emerge. During retirement, developers  
888 communicate their plan to stakeholders and can provide guidance on transitioning to alternatives.  
889 They archive benchmark data, code, and documentation. As a benchmark is retired, developers may  
890 share insights gained with the AI community. Finally, they should clearly mark the benchmark as  
891 “retired” on channels for deployment and platforms publishing its results.

## 892 D List of Assessed Benchmakrs

893 We evaluate these 16 foundation model benchmarks (alphabetical order):

- 894 • AgentBench [51]
- 895 • ARC Challenge [19]
- 896 • BBQ [64]

- 897 • BIG-bench [74]
- 898 • BOLD [26]
- 899 • Codex HumanEval [17]
- 900 • DecodingTrust [84]
- 901 • GPQA [68]
- 902 • GSM8k [21]
- 903 • HellaSwag [93]
- 904 • Machiavelli [63]
- 905 • MLCommons AI Safety v0.5 [82]
- 906 • MMLU [33]
- 907 • MMMU [92]
- 908 • TruthfulQA [50]
- 909 • WinoGrande [71]

910 We evaluate these 8 non-foundation model benchmarks (alphabetical order):

- 911 • ALE [11]
- 912 • FinRL-Meta [53]
- 913 • MedMNIST v2 [89]
- 914 • PDEBench [78]
- 915 • Procggen [20]
- 916 • RL Unplugged [31]
- 917 • SafeBench [88]
- 918 • Wordcraft [38]

## 919 E Sensitivity Analysis Details

Figure 8: Calculating the difference between the mean Usability and Design score between foundation model (FM) and non-foundation model (Non-FM) benchmarks with the data in Fig. 8. We show the lack of statistical significance of the difference using bootstrap resampling at a 95% confidence level.

920 We show that the difference in mean usability score between FM and non-FM benchmarks in Fig. 8  
 921 is not statistically significant using bootstrap resampling at a 95% confidence level.

922 **F Additional Results**

923 All individual benchmark scoring results, including justifications, can be found on *betterbench.stanford.edu*.  
 924

925 **F.1 Scores per lifecycle Stage**

Figure 9: In ascending order, design scores for each benchmark, separated for foundation model (FM) and non-foundation model (Non-FM) benchmarks.

Figure 10: In ascending order, implementation scores for each benchmark, separated for foundation model (FM) and non-foundation model (Non-FM) benchmarks.

926 We show the scores for each benchmark and for each benchmark lifecycle stage as barplots (Design:  
 927 Fig. 9, implementation: Fig. 10, documentation: Fig. 11, and maintenance Fig. 12). The scores for  
 928 each benchmark for each individual category can be found on our website, *betterbench.stanford.edu*.  
 929 For the bar plots for each stage, the benchmarks are shown in ascending order and marked as FM and  
 930 non-FM benchmark.

Figure 11: In ascending order, documentation scores for each benchmark, separated for foundation model (FM) and non-foundation model (Non-FM) benchmarks.

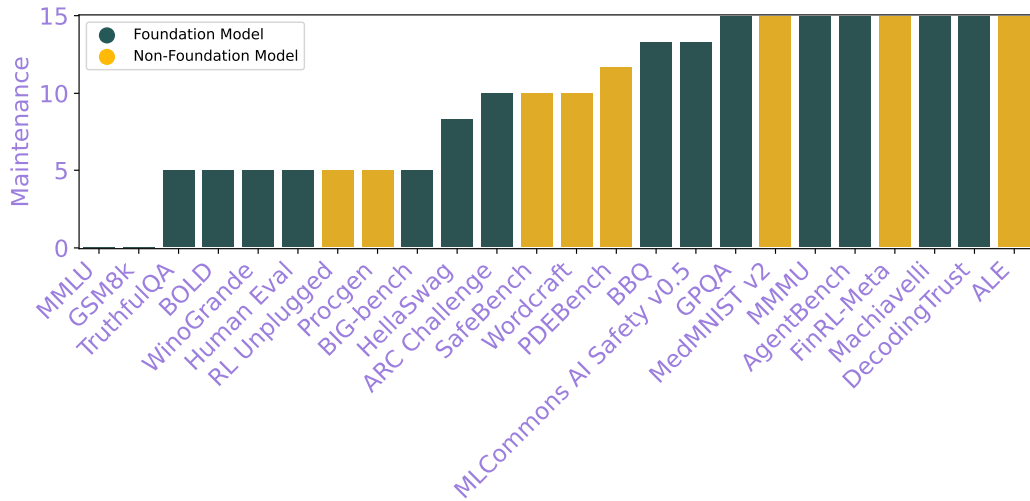

Figure 12: In ascending order, maintenance scores for each benchmark, separated for foundation model (FM) and non-foundation model (Non-FM) benchmarks.

## 931 G Scoring

932 We evaluate 24 benchmarks based on criteria grouped into category (a) (see Sec. 3), i.e., those  
 933 controlled by the benchmark developer where the authors and interviewees reached a normative  
 934 consensus. We use the following discrete point system to score each criteria:

- 935 • Criteria not acknowledged and not addressed: 0 points
- 936 • Criteria acknowledged but not addressed: 5 points
- 937 • Criteria partially addressed: 10 points
- 938 • Criteria fully addressed: 15 points
- 939 • Criteria not relevant: n/a

940 The highest possible score per category is 15, and the lowest is 0. The criteria span the benchmark  
 941 lifecycle stages of design, implementation, documentation, and maintenance. Benchmark retirement  
 942 is excluded from the assessment and scoring, since most benchmarks we looked at are still actively  
 943 used and not saturated, and given that we cannot predict/anticipate if benchmark developers would  
 944 in fact fulfill any criteria we'd list for this category. All individual evaluations are made publicly  
 945 available.

946 For each lifecycle stage, we calculate the average points earned across the relevant criteria for that  
 947 stage, excluding any criteria scored as “n/a”. This results in four subscores:

- 948 •  $s_D$  = Design score
- 949 •  $s_I$  = Implementation score
- 950 •  $s_{Do}$  = Documentation score
- 951 •  $s_M$  = Maintenance score

952 We do not differentiate the importance of criteria or effort to address them within each lifecycle stage,  
 953 weighting them equally in the average. To provide an overall assessment of a benchmark’s design  
 954 and usability, we aggregate the subscores into two key measures:

- 955 • Design score  $S_D$ :
  - 956 – Showcases how clear about a benchmark is about its intended purpose and scope and
  - 957 how interpretable it is
  - 958 – Equivalent to the design stage subscore  $s_D$
- 959 • Usability score  $S_U$ :
  - 960 – Indicates how easy the benchmark is use and how well it is documented and maintained
  - 961 – Weighted average of the implementation, documentation, and maintenance scores, see
  - 962 Equ. 1.

$$S_U = \frac{n_I s_I + n_{Do} s_{Do} + n_M s_M}{n_I + n_{Do} + n_M} \quad (1)$$

963 Where:

- 964 •  $S_U$  represents the usability score
- 965 •  $s_I$  represents the implementation score
- 966 •  $s_{Do}$  represents the documentation score
- 967 •  $s_M$  represents the maintenance score
- 968 •  $n_I$  represents the number of criteria in the implementation stage that are not n/a for the  
 969 respective benchmark
- 970 •  $n_{Do}$  represents the number of criteria in the documentation stage that are not n/a for the  
 971 respective benchmark
- 972 •  $n_M$  represents the number of criteria in the maintenance stage that are not n/a for the  
 973 respective benchmark

974 The discrete 0/5/10/15 point scale provides clearer differentiation between criteria that are not  
 975 addressed, partially addressed, and fully addressed compared to a continuous scale. At the same time,  
 976 it allows for a quantitative analysis compared to a letter grade scale like A/B/C/D. Allowing for an  
 977 N/A option handles criteria that may not be applicable to certain benchmarks. The 0/5/10/15 scale  
 978 also allows for more granular distinctions compared to a narrower scale like 0/1/2/3 in the final scores:  
 979 The difference between a score of 5 (acknowledged but not addressed) and 10 (partially addressed)  
 980 is easier to see than between a 2 and 3 on a narrower scale. With a smaller range, the difference  
 981 between scores is less meaningful and it is harder to separate the varying degrees of benchmark  
 982 quality. Providing subscores for each lifecycle stage, while rolling them up into overall Design and  
 983 Usability Scores, enables assessing benchmarks at both a category and aggregate level.

## 984 H Methodology Flow Diagram

985 Fig. 13 shows a detailed overview of the steps we took to derive the best practices that formed the  
986 basis of our AI benchmark assessment.

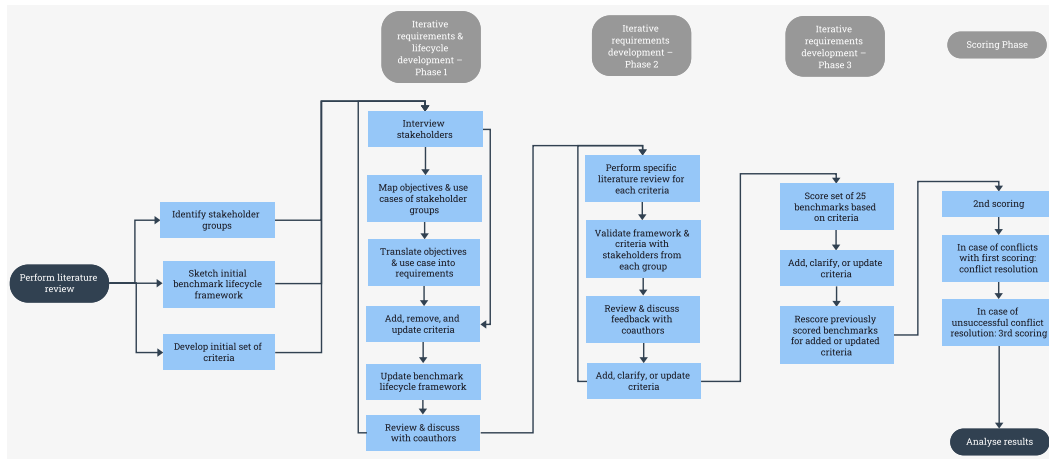

Figure 13: Flow diagram showing our detailed process how we derived the best practices for benchmarks.

## 987 I Release Requirements

- 988 1. Benchmark developers acknowledge that our checklist is a minimum quality assurance and  
989 not sufficient for high-quality benchmark construction.
- 990 2. Benchmark developers do not attempt to game our assessment, e.g. by just changing the  
991 code checked update on the GitHub repository side without actually checking their code's  
992 usability.

## 993 J BetterBench Checklist for Benchmark Developers

994 In this section, we provide the assessment criteria as a checklist for benchmark developers to use  
995 during their benchmark construction process, pre-deployment of the benchmark. If benchmark  
996 developers want to list their benchmark on our website, they will also have to submit this checklist.  
997 On the website, we will further provide an easy-to-fill-out checklist in  $\LaTeX$  and .doc format that can  
998 be easily included as part of any benchmark documentation. In the second subsection, we will also  
999 add an example of a filled out checklist assessing BetterBench, which can be seen as a benchmark for  
1000 benchmarks. Going through the checklist was part of the validation of our methodology, described in  
1001 Step 4 of the Sec. 3 section.

### 1002 J.1 Template

#### 1003 • Benchmark Design

- 1004  The tested capability, characteristic, or concept is defined  
1005     – TODO | YES | NO | N/A  
1006     – Justification:
- 1007  How tested capability or concept translates to benchmark task is described  
1008     – YES | NO | N/A  
1009     – Justification:
- 1010  How knowing about the tested concept is helpful in the real world is described.

- 1011                   – YES | NO | N/A
- 1012                   – Justification:
- 1013            How benchmark score should or shouldn't be interpreted/used is described
- 1014                   – YES | NO | N/A
- 1015                   – Justification:
- 1016            Domain experts are involved
- 1017                   – YES | NO | N/A
- 1018                   – Justification:
- 1019            Use cases and/or user personas are described
- 1020                   – YES | NO | N/A
- 1021                   – Justification:
- 1022            Domain literature is integrated
- 1023                   – YES | NO | N/A
- 1024                   – Justification:
- 1025            Informed performance metric choice
- 1026                   – YES | NO | N/A
- 1027                   – Justification:
- 1028            Metric floors and ceilings are included
- 1029                   – YES | NO | N/A
- 1030                   – Justification:
- 1031            Human performance level is included
- 1032                   – YES | NO | N/A
- 1033                   – Justification:
- 1034            Random performance level is included
- 1035                   – YES | NO | N/A
- 1036                   – Justification:
- 1037            Automatic evaluation is possible and validated
- 1038                   – YES | NO | N/A
- 1039                   – Justification:
- 1040            Differences to related benchmarks are explained
- 1041                   – YES | NO | N/A
- 1042                   – Justification:
- 1043            Input sensitivity is addressed
- 1044                   – YES | NO | N/A
- 1045                   – Justification:
- 1046           • **Benchmark Implementation**
- 1047            The evaluation code is available
- 1048                   – YES | NO | N/A
- 1049                   – Justification:
- 1050            The evaluation data or generation mechanism is accessible
- 1051                   – YES | NO | N/A
- 1052                   – Justification:
- 1053            The evaluation of models via API is supported
- 1054                   – YES | NO | N/A
- 1055                   – Justification:
- 1056            The evaluation of local models is supported
- 1057                   – YES | NO | N/A

- 1058           – Justification:
- 1059        A globally unique identifier is added or evaluation instances are encrypted
- 1060           – YES | NO | N/A
- 1061           – Justification:
- 1062        A task to identify if model is included trained on benchmark data
- 1063           – YES | NO | N/A
- 1064           – Justification:
- 1065        A script to replicate results is explicitly included
- 1066           – YES | NO | N/A
- 1067           – Justification:
- 1068        Statistical significance or uncertainty quantification of benchmark results is reported
- 1069           – YES | NO | N/A
- 1070           – Justification:
- 1071        Need for warnings for sensitive/harmful content is assessed
- 1072           – YES | NO | N/A
- 1073           – Justification:
- 1074        A build status (or equivalent) is implemented
- 1075           – YES | NO | N/A
- 1076           – Justification:
- 1077        Release requirements are specified
- 1078           – YES | NO | N/A
- 1079           – Justification:
- 1080       • **Benchmark Documentation**
- 1081        Requirements file or equivalent is available
- 1082           – YES | NO | N/A
- 1083           – Justification:
- 1084        Quick-start guide or demo is available
- 1085           – YES | NO | N/A
- 1086           – Justification:
- 1087        In-line code comments are used
- 1088           – YES | NO | N/A
- 1089           – Justification:
- 1090        Code documentation is available
- 1091           – YES | NO | N/A
- 1092           – Justification:
- 1093        Accompanying paper is accepted at peer-reviewed venue
- 1094           – YES | NO | N/A
- 1095           – Justification:
- 1096        Benchmark construction process is documented
- 1097           – YES | NO | N/A
- 1098           – Justification:
- 1099        Test tasks & rationale are documented
- 1100           – YES | NO | N/A
- 1101           – Justification:
- 1102        Assumptions of normative properties are documented
- 1103           – YES | NO | N/A
- 1104           – Justification:

- 1105  Limitations are documented
  - 1106 – YES | NO | N/A
  - 1107 – Justification:
- 1108  Data collection, test environment design, or prompt design process is documented
  - 1109 – YES | NO | N/A
  - 1110 – Justification:
- 1111  Evaluation metric is documented
  - 1112 – YES | NO | N/A
  - 1113 – Justification:
- 1114  Applicable license is specified
  - 1115 – YES | NO | N/A
  - 1116 – Justification:
- 1117 • **Benchmark Maintenance**
  - 1118  Code usability was checked within the last year
    - 1119 – YES | NO | N/A
    - 1120 – Justification:
  - 1121  Maintained feedback channel for users is available
    - 1122 – YES | NO | N/A
    - 1123 – Justification:
  - 1124  Contact person is listed
    - 1125 – YES | NO | N/A
    - 1126 – Justification:

## 1127 J.2 Example

1128 As noted in Sec. 3, we assessed BetterBench against our own assessment framework to verify that the  
 1129 framework is usable and practicable. This section showcases this assessment and gives an example of  
 1130 a filled-out checklist, based on the template provided in App. J.1,

- 1131 • **Benchmark Design**
  - 1132  The tested capability, characteristic, or concept is defined
    - 1133 – YES
    - 1134 – Justification: “We define a *high-quality* benchmark to be one that is clear about its  
 1135 intended purpose and scope, and that is usable. To date, no structured assessment  
 1136 for the quality of AI benchmarks, including both FM and non-FM benchmarks, has  
 1137 been published to date, and no comparative analysis was conducted to understand  
 1138 quality differences between widely used benchmarks in the field. This paper  
 1139 addresses these gaps”(Sec. 1)
  - 1140  How tested capability or concept translates to benchmark task is described
    - 1141 – YES
    - 1142 – Justification: For detail, see Sec. 4 and App. K
  - 1143  How knowing about the tested concept is helpful in the real world is described.
    - 1144 – YES
    - 1145 – Justification: Justification: “By releasing the first systematic assessment framework  
 1146 for AI benchmarks, we aim to encourage benchmark developers to construct higher-  
 1147 quality benchmarks and to contribute to community efforts to make AI evaluations  
 1148 more practicable and transparent. Higher-quality benchmarks resulting from the  
 1149 adoption of our framework and checklist can lead to better-informed model selection  
 1150 for downstream tasks, potentially reducing risks and improving outcomes in high-  
 1151 stakes applications” (Sec. 9).

- 1152  How benchmark score should or shouldn't be interpreted/used is described
- 1153     – YES
- 1154     – Justification: “Our living repository of benchmark assessments promotes transparency and comparability, allowing benchmark users to make informed decisions
- 1155         when choosing benchmarks. However, there is a potential risk of misinterpretation
- 1156         of our results; our assessment only provides minimum quality assurances and is not
- 1157         sufficient to assess the suitability of a benchmark for a concrete use case” (Sec. 9).
- 1158
- 1159  Domain experts are involved
- 1160     – YES
- 1161     – Justification: “Initially, we surveyed the existing benchmark landscape (Sec. 2).
- 1162         Based on this review, we identified five stakeholder groups who present the user
- 1163         personas of our assessment (App. B). All stakeholder groups were represented
- 1164         in subsequent unstructured interviews which included 20+ policymakers, model
- 1165         developers, benchmark developers, model users, and AI researchers, to understand
- 1166         their objectives w.r.t. benchmarking. During this process, we developed a five-
- 1167         stage model of the benchmark lifecycle (Fig. 5 and App. C) and mapped the
- 1168         benchmarking objectives of the stakeholders, along with their communicated use
- 1169         cases of a benchmark assessment (App. B)” (Sec. 3).
- 1170  Use cases and/or user personas are described
- 1171     – YES
- 1172     – Justification: “We identified five stakeholder groups who present the user personas
- 1173         of our assessment” (Sec. 3, see full personas and use cases in App. B).
- 1174  Domain literature is integrated
- 1175     – YES
- 1176     – Justification: “Our work is informed by benchmarking practices from fields beyond AI, ranging from transistor hardware [18] to environmental quality [16] to bioinformatics [7], and identify common themes regarding what constitutes an effective benchmark. When applicable, we incorporate these best practices into our assessment (Sec. 4).” Citations for this literature, when used, are provided in Sec. 4.
- 1177
- 1178
- 1179
- 1180
- 1181
- 1182  Informed performance metric choice
- 1183     – YES
- 1184     – Justification: “The discrete 0/5/10/15 point scale provides clearer differentiation
- 1185         between criteria that are not addressed, partially addressed, and fully addressed
- 1186         compared to a continuous scale. At the same time, it allows for a quantitative
- 1187         analysis compared to a letter grade scale like A/B/C/D. Allowing for an N/A option
- 1188         handles criteria that may not be applicable to certain benchmarks.” Full details on
- 1189         our scoring method are available in App. G.
- 1190  Metric floors and ceilings are included
- 1191     – YES
- 1192     – Justification: “The highest possible score per category is 15, and the lowest is 0”
- 1193         (App. G).
- 1194  Human performance level is included
- 1195     – N/A
- 1196     – Justification: In our work, we manually evaluate AI benchmarks; a human could
- 1197         not be used as an evaluation target in our context.
- 1198  Random performance level is included
- 1199     – N/A
- 1200     – Justification: Random generation cannot constitute an AI benchmark.
- 1201  Automatic evaluation is possible and validated
- 1202     – N/A

- 1203                   – Justification: “Given the varying information sources (official websites, papers,  
1204                   GitHub repositories published by the benchmark developers that we do consult  
1205                   to assess benchmarks, and given that they do not follow a standard structure, we  
1206                   manually evaluate all benchmarks” (Sec. 3).
- 1207           □ Differences to related benchmarks are explained
- 1208                   – YES
- 1209                   – Justification: “Unlike prior studies, such as [59] and [49], which focus on identifying  
1210                   the limitations, our approach offers a practical evaluation, empowering developers  
1211                   to address shortcomings and enhance benchmark quality directly” (Sec. 2.1).
- 1212           □ Input sensitivity is addressed
- 1213                   – N/A
- 1214                   – Justification: Since our benchmark uses human evaluation, we select a single  
1215                   phrasing for each criterion. As described in Sec. 3 these phrasings were developed  
1216                   iteratively to maximize clarity and minimize disagreement amongst multiple  
1217                   annotators of the same benchmark.
- 1218   • **Benchmark Implementation**
- 1219           □ The evaluation code is available
- 1220                   – N/A
- 1221                   – Justification: We performed human evaluation which did not use code.
- 1222           □ The evaluation data or generation mechanism is accessible
- 1223                   – N/A
- 1224                   – Justification: We evaluate benchmarks based on “official websites, papers, GitHub  
1225                   repositories published by the benchmark developers” (Sec. 3). The availability of  
1226                   these materials is dependent on benchmark developers.
- 1227           □ The evaluation of models via API is supported
- 1228                   – N/A
- 1229                   – Justification: We evaluate benchmarks rather than models.
- 1230           □ The evaluation of local models is supported
- 1231                   – N/A
- 1232                   – Justification: We evaluate benchmarks rather than models.
- 1233           □ A globally unique identifier is added or evaluation instances are encrypted
- 1234                   – N/A
- 1235                   – Justification: Our benchmark does not evaluate AI models or include any examples  
1236                   which they could be contaminated by training on.
- 1237           □ A task to identify if model is included trained on benchmark data
- 1238                   – N/A
- 1239                   – Justification: Our benchmark does not evaluate AI models or include any examples  
1240                   which they could be contaminated by training on.
- 1241           □ A script to replicate results is explicitly included
- 1242                   – N/A
- 1243                   – Justification: The code to replicate results will be added as supplementary material  
1244                   and published as part of a GitHub repo upon publication.
- 1245           □ Statistical significance or uncertainty quantification of benchmark results is reported
- 1246                   – YES
- 1247                   – Justification: These results are reported in Sec. 6 and App. E.
- 1248           □ Need for warnings for sensitive/harmful content is assessed
- 1249                   – YES
- 1250                   – Justification: “The outputs of our evaluation do not contain sensitive or harmful  
1251                   content, but users may encounter such content during a benchmark assessment  
1252                   depending on the benchmark’s data” (Sec. 9).

- 1253  A build status (or equivalent) is implemented
- 1254     – YES
- 1255     – Justification: A build status will be included in the code released as part of a GitHub
- 1256         repo upon publication.
- 1257  Release requirements are specified
- 1258     – YES
- 1259     – Justification: Release requirements are provided in App. I.
- 1260 • **Benchmark Documentation**
- 1261  Requirements file or equivalent is available
- 1262     – YES
- 1263     – Justification: A requirements file will be included in the code released as part of a
- 1264         GitHub repo upon publication.
- 1265  Quick-start guide or demo is available
- 1266     – YES
- 1267     – Justification: We provide a checklist to facilitate use of our benchmark in App. J
- 1268         and an example of its use in App. J.2. Additionally, we will include a quick-start
- 1269         guide for our code in the GitHub repo released upon publication.
- 1270  In-line code comments are used
- 1271     – YES
- 1272     – Justification: Our GitHub repository includes in-line code comments.
- 1273  Code documentation is available
- 1274     – YES
- 1275     – Justification: Our GitHub repository includes code documentation.
- 1276  Accompanying paper is accepted at peer-reviewed venue
- 1277     – N/A
- 1278     – Justification: Our paper is currently under submission at a peer-reviewed venue.
- 1279  Benchmark construction process is documented
- 1280     – YES
- 1281     – Justification: We describe our full process in Sec. 3.
- 1282  Test tasks & rationale are documented
- 1283     – YES
- 1284     – Justification: Definitions and justifications for all criteria are presented in App. K.
- 1285  Assumptions of normative properties are documented
- 1286     – YES
- 1287     – Justification:
- 1288  Limitations are documented
- 1289     – YES
- 1290     – Justification: We discuss limitations in Sec. 8.
- 1291  Data collection, test environment design, or prompt design process is documented
- 1292     – YES
- 1293     – Justification: We describe how we performed our evaluations in Sec. 3.
- 1294  Evaluation metric is documented
- 1295     – YES
- 1296     – Justification: “We define a *high-quality* benchmark to be one that is interpretable
- 1297         and clear about its intended purpose and scope, and that is usable” Sec. 1. We
- 1298         further describe how we operationalized “quality” and calculate its subcomponents
- 1299         (design and usability) in Fig. 9 and Sec. 3.
- 1300  Applicable license is specified

- 1301           – YES
- 1302           – Justification: We release our assessment under CC BY 4.0 license, available on our
- 1303           website (Sec. 3).
- 1304    • **Benchmark Maintenance**
- 1305            Code usability was checked within the last year
- 1306           – YES
- 1307           – Justification: We have checked the usability of the code in our GitHub repository
- 1308           and will verify it again upon publication.
- 1309            Maintained feedback channel for users is available
- 1310           – YES
- 1311           – Justification: “Finally, we develop a supplementary website to continuously publish
- 1312           assessment results using the scoring methodology in App. G, given the rapid
- 1313           development of new benchmarks. The website includes a community feedback
- 1314           channel for submitting new AI benchmarks and correcting previously posted scores
- 1315           if benchmarks are updated or stakeholders disagree with our evaluation” (Sec. 3).
- 1316            Contact person is listed
- 1317           – YES
- 1318           – Justification: Contact details will be listed on our website.

## 1319 **K Full Assessment Criteria**

### 1320 **K.1 Benchmark Design**

#### 1321 **1. Definition of tested capability or characteristic**

- 1322           • **Explanation:** The benchmark developers mention and define what underlying capabil-
- 1323           ity or characteristic of a model is supposed to be tested with the benchmark.
- 1324           • **Justification:** Defining the objective of the benchmark is necessary for clarity in
- 1325           its design. It also helps users determine if the benchmark aligns with their specific
- 1326           application needs and ensures that users and developers have a shared understanding of
- 1327           the concept being evaluated, facilitating consistent interpretation of results.
- 1328           • **Points:**
- 1329           – 0: Tested concept, capability, or characteristic not explicitly mentioned.
- 1330           – 5: Tested concept explicitly mentioned and need for definition acknowledged, but
- 1331           definition not provided.
- 1332           – 10: Tested concept, capability, or characteristic explicitly mentioned but not defined.
- 1333           – 15: Tested concept, capability, or characteristic explicitly mentioned and defined.

#### 1334 **2. Description of how tested capability or concept translates to benchmark task**

- 1335           • **Explanation:** The benchmark developers describe how the tested capability or charac-
- 1336           teristic translates to the task implemented in the benchmark/the task the model is tested
- 1337           on in the benchmark.
- 1338           • **Justification:** Clearly explaining this translation ensures that the benchmark tasks accu-
- 1339           rately reflect the intended tested capabilities and concepts, providing valid assessment
- 1340           results.
- 1341           • **Points:**
- 1342           – 0: No description of how the tested capability or concept translates to the benchmark
- 1343           task.
- 1344           – 5: Acknowledgement that not describing how the tested capability or concept
- 1345           translates to the benchmark task is an issue, but no description provided.
- 1346           – 10: Description of how tested capability or concept translates to benchmark tasks
- 1347           provided for some but not all tasks.

1348 – 15: Description of how tested capability or concept translates to benchmark tasks  
1349 provided for all tasks.

### 1350 3. Description of how knowing about the tested concept is helpful in the real world

1351 • **Explanation:** The developers describe why it is useful to know about the tested  
1352 capability in the real world.

1353 • **Justification:** This description helps users understand the practical value of the bench-  
1354 mark, demonstrating how the tested capability impacts real-world applications and use  
1355 cases.

#### 1356 • **Points:**

1357 – 0: No description of how knowing about the tested concept is helpful in the real  
1358 world.

1359 – 5: Acknowledgement that not describing how knowing about the tested concept is  
1360 helpful in the real world is an issue, but no description provided.

1361 – 10: Limited description of how knowing about the tested concept is helpful in the  
1362 real world.

1363 – 15: Full description of how knowing about the tested concept is helpful in the real  
1364 world.

### 1365 4. Description of use cases and user personas for the benchmark

1366 • **Explanation:** A use case for an AI benchmark involves specifying a scenario in  
1367 which the AI system will be evaluated. This scenario should include the cultural and  
1368 geographic context and the type of interactions between humans and models [82], if  
1369 applicable. Additionally, user personas should be defined to represent the different  
1370 types of users that might interact with the AI system, if applicable. As a concrete  
1371 example, [82] states “The use case for the v0.5 Benchmark is an adult chatting to a  
1372 general-purpose assistant in English. The cultural and geographic context is Western  
1373 Europe & North America. We define a use case as a set of interactions between human  
1374 and model to achieve a goal (or goals). [...] For the v0.5 Benchmark, we are focusing on  
1375 three personas: (i) a typical adult user; (ii) an adult user intent on malicious activities,  
1376 behaving in a technically non-sophisticated way; and (iii) an adult user at risk of harm,  
1377 behaving in a technically non-sophisticated way.”

1378 • **Justification:** Use cases set the context and scope of the benchmark. User personas  
1379 outline an understanding of the different types of interactions the benchmark developers  
1380 anticipate the tested AI system to be used in, e.g., ranging from typical users to those  
1381 with specific challenges or malicious intent. This approach ensures that the design of  
1382 the benchmark is closely related to real-world applications and that it’s effective across  
1383 diverse scenarios.

#### 1384 • **Points:**

1385 – 0: The benchmark does not include any description of use cases or user personas.

1386 – 5: The benchmark acknowledges the importance of use cases or user personas but  
1387 does not explicitly formulate or describe them.

1388 – 10: The benchmark provides a partial description of use cases or user personas.

1389 – 15: The benchmark fully describes use cases and user personas, specifying the  
1390 cultural and geographic context, types of human-model interactions (if applicable),  
1391 and representing different user types that might interact with the AI system (if  
1392 applicable).

1393 – n/a: For AI systems that do not involve direct human interaction, such as those  
1394 used in industrial automation or scientific simulations, defining user personas is not  
1395 relevant. However, real-world use cases should still be specified; in more theoretical  
1396 benchmarks, this use case might be to advance research.

### 1397 5. Involvement of domain experts

- 1398 • **Explanation:** Domain expert(s) who have a professional background or research  
1399 experience in the concept to be tested are either co-authors of the paper, or were  
1400 involved in the benchmark design process, i.e., the paper makes clear how they obtained  
1401 the expertise and how that informed the benchmark design.
- 1402 • **Justification:** Involving domain experts ensures that the benchmark design is informed  
1403 by deep, specialized knowledge, increasing its validity and relevance. This expertise  
1404 helps to create tasks that accurately assess the targeted capabilities and align with  
1405 real-world scenarios.
- 1406 • **Points:**
  - 1407 – 0: None of the authors has a background in the benchmark domain and no external  
1408 experts were consulted during the design process.
  - 1409 – 5: The benchmark mentions the necessity for in-domain expertise but doesn't  
1410 specify any further details.
  - 1411 – 10: The benchmark mentions that domain experts were consulted but not how their  
1412 insights influenced the benchmark design.
  - 1413 – 15: At least one of the co-authors has a professional or academic background in the  
1414 benchmark domain or the benchmark specified how external experts were consulted  
1415 and how that influenced the design process.

## 1416 6. Integration of domain literature

- 1417 • **Explanation:** The developers cite domain literature in the background section and  
1418 describe how insights from this literature informed the design of their benchmark or  
1419 cite relevant domain literature in the benchmark design process.
- 1420 • **Justification:** By consulting domain-specific literature, benchmark developers can  
1421 ensure that the tasks and evaluation criteria they include are representative and aligned  
1422 with the current state of knowledge in the field. This literature often contains valuable  
1423 insights into best practices, established methodologies, and proven approaches for  
1424 evaluating the tested concept, which can be incorporated into the benchmark design to  
1425 enhance its reliability.
- 1426 • **Points:**
  - 1427 – 0: The benchmark does not reference domain-specific literature.
  - 1428 – 5: The benchmark mentions the need to integrate domain literature but did not  
1429 address it in the background section or design process.
  - 1430 – 10: The benchmark references domain literature in the background or related work  
1431 section but does not describe how that domain literature informed the benchmark  
1432 design process.
  - 1433 – 15: The benchmark references domain literature throughout the paper and describes  
1434 how that domain literature informed the benchmark design process.

## 1435 7. Description of how benchmark score should or shouldn't be interpreted/used

- 1436 • **Explanation:** The benchmark developers provide information about what benchmark  
1437 users can and cannot take away from the benchmark score.
- 1438 • **Justification:** Clarifying the interpretation of benchmark scores prevents misuse and  
1439 misinterpretation, ensuring that users draw accurate conclusions about a model's  
1440 performance. This guidance helps users apply the scores appropriately within their  
1441 specific contexts, and understand if the benchmark can be used to assess a model for  
1442 their desired application context.
- 1443 • **Points:**
  - 1444 – 0: The benchmark does not comment on how the benchmark scores should or  
1445 should not be interpreted.
  - 1446 – 5: The benchmark acknowledges that the benchmark scores need to be interpreted  
1447 but gives no guidance on how or how not to do that.

- 1448                   – 10: The benchmark describes how scores should or should not be interpreted or  
1449                   used, but not both.  
1450                   – 15: The benchmark describes how scores should and should not be interpreted or  
1451                   used.

#### 1452 8. Informed choice of performance metric(s)

- 1453           • **Explanation:** The developers describe how the performance metric for the defined  
1454           benchmark task should be interpretable, meaningful, and standard for the task that's  
1455           being evaluated [34]. If a non-standard metric is selected, they describe their rationale  
1456           for choosing a non-standard metric.
- 1457           • **Justification:** The metric should be easily understood by the reader to build their own  
1458           opinion about the model's capabilities, given the benchmark score. If a non-standard  
1459           metric is used, an explanation is necessary to clarify its relevance and ensure that users  
1460           can accurately interpret the results. [34]
- 1461           • **Points:**
  - 1462                   – 0: The benchmark does not mention an evaluation metric or does not explain the  
1463                   choice of metric.
  - 1464                   – 5: The benchmark acknowledges the need for an informed metric choice but does  
1465                   not justify their metric choice.
  - 1466                   – 10: The benchmark provides an explanation for the choice of some but not all of  
1467                   their metrics.
  - 1468                   – 15: The benchmark provides an explanation for the choice of all of their metrics.

#### 1469 9. Includes floors and ceilings for metric

- 1470           • **Explanation:** The benchmark provides clear floors and ceilings for the metric(s) it  
1471           uses [34].
- 1472           • **Justification:** Establishing clear floors and ceilings for metrics ensures that users have  
1473           a reference point for understanding model performance. It helps users understand if a  
1474           benchmark is already saturated or if progress can be made on the task [34]. This also  
1475           allows benchmark developers to decide when a benchmark should be retired.
- 1476           • **Points:**
  - 1477                   – 0: The benchmark does not provide any metric floors or ceilings.
  - 1478                   – 5: Floors and ceilings are shown in the results figure but not explicitly mentioned  
1479                   in the text.
  - 1480                   – 10: The benchmark provides floors and ceilings for some but not all evaluation  
1481                   metrics.
  - 1482                   – 15: The benchmark provides floors and ceilings for all evaluation metrics.

#### 1483 10. Includes human performance level

- 1484           • **Explanation:** The benchmark explicitly states human performance measured on the  
1485           benchmark task [34]. It also explains how human performance was measured and if  
1486           this was the performance of an average or expert group of humans. The benchmark  
1487           notes if measuring human performance is not possible on the benchmark task and why.
- 1488           • **Justification:** Similar to the previous criteria, including human performance on a  
1489           benchmark allows the reader to put the model's performance into perspective and allows  
1490           for a better interpretability of the benchmarking score [34].
- 1491           • **Points:**
  - 1492                   – 0: The benchmark does not state human performance and does not explain why  
1493                   this is not applicable here.
  - 1494                   – 5: The benchmark mentions human performance in passing but does not provide a  
1495                   measurement or explanation.
  - 1496                   – 10: The benchmark states human performance but does not explain how it was  
1497                   obtained.

- 1498 – 15: The benchmark states human performance and explains how it was obtained.
- 1499 – n/a: The benchmark task cannot be completed by a human, and hence reporting
- 1500 human performance is not possible.

#### 1501 11. Includes random performance level

- 1502 • **Explanation:** The developers explicitly states the random performance measured on
- 1503 the benchmark [34].
- 1504 • **Justification:** By establishing a baseline performance level achieved through random
- 1505 guessing, generation, or selection, benchmark users can better understand the extent
- 1506 to which a model’s performance stems from its inherent capabilities, rather than
- 1507 mere chance or the benchmarks design and especially metric choices. This random
- 1508 performance level serves as a reference point, allowing for a clearer assessment of the
- 1509 model’s true effectiveness in tackling the specific task at hand.
- 1510 • **Points:**
- 1511 – 0: The benchmark does not state random performance and does not explain why
- 1512 this is not applicable here.
- 1513 – 5: The benchmark mentions random performance but does not provide quantitative
- 1514 random performance on the benchmark task(s).
- 1515 – 10: The benchmark states random performance for some but not all tasks.
- 1516 – 15: The benchmark states random performance for all tasks.
- 1517 – n/a: Measuring random performance on the benchmark task is not possible, and
- 1518 hence reporting random performance is not applicable.

#### 1519 12. Addresses input sensitivity

- 1520 • **Explanation:** The benchmark contains multiple input variations with the same semantic
- 1521 meaning/intended to elicit the same response or output by the tested model. The
- 1522 developers describe all relevant details such as how many different variations were
- 1523 tested per prompt, and how the variations were designed. For language models, this
- 1524 would mean including a variety of semantically (but not syntactically) equivalent
- 1525 prompts to combat prompt sensitivity [73, 42, 55, 72]. For computer vision models,
- 1526 this could mean inputting a normal, a blurred, and a cropped version of the same image,
- 1527 etc.), while for reinforcement learning, this could mean measuring the sensitivity of
- 1528 learned policies to input features [56].
- 1529 • **Justification:** Addressing input sensitivity in a benchmark ensures that the model’s
- 1530 performance is consistent across semantically equivalent inputs, thus validating its
- 1531 robustness. Including multiple variations per input and detailing their design allows for
- 1532 inspection and replicable evaluation of the model’s capabilities. This serves the goal of
- 1533 approximating intrinsic model capabilities or harms better rather than just measuring
- 1534 “an artifact” [61] of your input.
- 1535 • **Points:**
- 1536 – 0: The benchmark does not mention or address input sensitivity.
- 1537 – 5: The benchmark mentions the issue of input sensitivity but does not describe
- 1538 experiments to test for it.
- 1539 – 10: The benchmark includes some input variations with the same semantic meaning
- 1540 but lacks thorough descriptions or details on the number of variations and their
- 1541 design.
- 1542 – 15: The benchmark contains multiple input variations with the same semantic
- 1543 meaning, providing detailed descriptions of all relevant details such as the number
- 1544 of variations per prompt and how they were designed.

#### 1545 13. Validated automatic evaluation available

- 1546 • **Explanation:** Evaluating a model against a benchmark does not require human evalua-
- 1547 tion in the process and the quality of the automated evaluation is validated (if applicable,
- 1548 e.g., in the case of FM-based evaluations).

- 1549 • **Justification:** Requiring human feedback to evaluate performance on a benchmark will
- 1550 significantly limit the scalability of the benchmark and potentially introduce biases from
- 1551 the human evaluators themselves. In addition, this may require an IRB for researchers,
- 1552 and will be more costly than an automatic evaluation, creating “major barriers to entry”
- 1553 [34].
- 1554 • **Points:**
- 1555 – 0: The benchmark does not provide any form of automatic evaluation and relies
- 1556 entirely on human evaluation.
- 1557 – 5: The benchmark mentions the benefits of automatic evaluation but provides no or
- 1558 limited automatic valuation.
- 1559 – 10: The benchmark includes an automatic evaluation method but does not offer any
- 1560 validation.
- 1561 – 15: The benchmark includes an automatic evaluation method and describes how it
- 1562 was validated as well as the results of the validation.

#### 1563 14. Explanation of differences to related benchmarks

- 1564 • **Explanation:** The benchmark developers explain how their benchmark fills a gap
- 1565 compared to existing benchmarks or how it expands on existing benchmarks or their
- 1566 tested concepts.
- 1567 • **Justification:** Benchmark developers demonstrate the added value and relevance of
- 1568 the new benchmark, justifying its necessity by addressing specific gaps in existing
- 1569 benchmarks or by expanding on saturated benchmarks. This allows users to better
- 1570 understand the differences between related benchmarks and determine which one to
- 1571 use for their specific evaluation context.
- 1572 • **Points:**
- 1573 – 0: The benchmarks do not explain any differences or relevance to existing bench-
- 1574 marks.
- 1575 – 5: The benchmark briefly mentions existing benchmarks but provides no explana-
- 1576 tions of differences or added value.
- 1577 – 10: The benchmark provides an explanation of how it fills a gap or expands on
- 1578 existing benchmarks for some but not all mentioned related benchmarks.
- 1579 – 15: The benchmark provides an explanation of how it fills a gap or expands on
- 1580 existing benchmarks for all mentioned related benchmarks.

## 1581 K.2 Benchmark Implementation

### 1582 1. Availability of evaluation code

- 1583 • **Explanation:** The benchmark developers make the code available for others to evaluate
- 1584 their own models against the benchmark, e.g., as part of a GitHub repository.
- 1585 • **Justification:**
- 1586 • **Points:** Without access to the benchmarking procedure itself, the benchmark cannot
- 1587 be scrutinized by external parties to verify its reliability and adequacy, nor can it be
- 1588 utilized for independent evaluations and comparisons by benchmark users. In addition,
- 1589 if benchmark users have to write their evaluation code from scratch, its more likely that
- 1590 seemingly minor implementation details affect the measured performance, hindering a
- 1591 fair comparison [13].
- 1592 – 0: The evaluation code is not publicly available.
- 1593 – 5: The benchmark mentions the availability of evaluation code but does not provide
- 1594 access to it.
- 1595 – 10: The evaluation code is publicly available for some metrics described by the
- 1596 benchmark.
- 1597 – 15: The evaluation code is publicly available for all metrics described by the
- 1598 benchmark.

## 2. Script to replicate results is explicitly included

- **Explanation:** The benchmark developers give access to the input, output, and evaluation code, as well as all other necessary information (e.g., hyperparameters or random seed set) that they used to create the initial benchmarking results presented in the paper.
- **Justification:** Providing access to the input, output, and code allows for transparency and reproducibility of the reported results, fostering trust into the benchmark, and contributing to overcome the current reproducibility crisis in AI/ML research [35].
- **Points:**
  - 0: The developers do not provide a script to reproduce the results.
  - 5: The issue of result replicability is mentioned in the benchmark paper but not addressed.
  - 10: A script to reproduce some results in the benchmark paper is available.
  - 15: A script to reproduce all results in the benchmark paper is available.

## 3. Accessibility of evaluation data, prompts, or dynamic environment

- **Explanation:** The benchmark developers make the evaluation data, prompts, or the data/environment generation mechanism accessible. These do not have to be made public in order to earn full points (if contamination is a concern, for example), but some access to it for evaluation purposes, e.g., by hosting it privately on Hugging Face, needs to be possible.
- **Justification:** Without any accessibility of the evaluation data, prompts, or environment generation mechanism, a benchmark cannot be used.
- **Points:**
  - 0: No access to evaluation data, prompts, or data/environment generation mechanism is provided.
  - 5: The existence of evaluation data, prompts, or data/environment generation mechanism is mentioned, but no concrete access is provided.
  - 10: Partial access to evaluation data, prompts, or data/environment generation mechanism is provided, allowing for limited evaluation.
  - 15: Full access to evaluation data, prompts, or data/environment generation mechanism is provided, enabling comprehensive evaluation.

## 4. Supports evaluation of models via API calls

- **Explanation:** The benchmark developers allow the benchmark evaluation of models via API access, if applicable.
- **Justification:** This criteria is dependent on the subfield. In NLP, for example, closed-source models such as GPT-4 are oftentimes only accessible via API. Without support for API evaluation, they cannot be evaluated, which is especially problematic if such models are the state-of-the-art models in the field.
- **Points:**
  - 0: The benchmark does not support evaluation of models via API calls.
  - 5: The benchmark mentions the possibility of API evaluation but does not provide concrete implementation details.
  - 10: The benchmark supports evaluation of models via one API.
  - 15: The benchmark supports evaluation of models via two or more APIs to different models.

## 5. Supports evaluation of local models

- **Explanation:** The benchmark developers implement code to support the evaluation of local models without API access.
- **Justification:** Some model developers only host their models locally. A benchmark should support the evaluation of those to allow for a wide variety of models to be evaluated against the benchmark.

- 1649 • **Points:**
- 1650 – 0: The benchmark requires users to write their own code to evaluate a local model.
- 1651 – 5: The benchmark mentions that local evaluation should be possible but doesn't
- 1652 provide corresponding code.
- 1653 – 10: The benchmark provides minimal support for local model evaluation, requiring
- 1654 significant user effort.
- 1655 – 15: The benchmark provides full support for local model evaluation with user-
- 1656 friendly code.

## 1657 6. Inclusion of a globally unique identifier or encryption of evaluation instances

- 1658 • **Explanation:** Benchmark developers include a globally unique identifier (GUID) or
- 1659 canary string in the main public evaluation code and all public evaluation prompt or
- 1660 data files. Alternatively, they encrypt the test data files and make the key public.
- 1661 • **Justification:** Including a GUID in relevant (sub-)repositories, public code and data
- 1662 repositories can support the identification of data contamination in models [74], either
- 1663 by allowing model developers to filter out the evaluation data out of large amounts
- 1664 of web-scraped data or by allowing benchmark developers to identify which model
- 1665 developers trained on their data and hence have created models that potentially perform
- 1666 better than they would otherwise on the benchmark. Encrypted test data files prevent
- 1667 non-adversarial crawling of such data; however, [36] advise against “using standard
- 1668 obfuscation or compression methods that are not key-protected, since some crawling
- 1669 systems include pipelines of automatic decompression or deobfuscation.”
- 1670 • **Points:**
- 1671 – 0: The benchmark does not include a GUID or encryption of evaluation instances.
- 1672 – 5: The benchmark acknowledges the risk of contamination but does not address it.
- 1673 – 10: The benchmark partially implements a GUID or encryption, but not consistently
- 1674 across all relevant files.
- 1675 – 15: The benchmark consistently includes a GUID or encryption across all relevant
- 1676 files and repositories.

## 1677 7. Inclusion of 'training\_on\_test\_set' task

- 1678 • **Explanation:** The benchmark includes a task to identify if the model was trained on
- 1679 the benchmark data.
- 1680 • **Justification:** Public benchmarks face the challenges that their evaluation data may be
- 1681 web-scraped and used to train a model. A 'training\_on\_test\_set' task can serve as a
- 1682 “post-hoc diagnosis of whether [... benchmark] data was used in model training.” [74]
- 1683 • **Points:**
- 1684 – 0: The benchmark does not include a 'training\_on\_test\_set' task.
- 1685 – 5: The benchmark mentions the possibility that models were trained on its data but
- 1686 does not provide a way to check it.
- 1687 – 10: The benchmark includes a partial or limited implementation of a 'train-
- 1688 ing\_on\_test\_set' task that only tests for part of the data used.
- 1689 – 15: The benchmark includes a comprehensive 'training\_on\_test\_set' task.

## 1690 8. Assess need for warnings for sensitive/harmful content

- 1691 • **Explanation:** Benchmark developers explicitly mention in the paper if the evaluation
- 1692 tasks or the expected output may contain sensitive or harmful content. If they do not
- 1693 anticipate sensitive/harmful content in either case, they should explicitly state that.
- 1694 • **Justification:** By explicitly stating the presence of sensitive or harmful content and
- 1695 issuing appropriate warnings, developers help users make informed decisions and take
- 1696 necessary precautions. Even if developers do not expect sensitive or harmful content, if
- 1697 they state that, they showcase to the benchmark users that they actually thought about
- 1698 the possibility. Otherwise, users couldn't be sure if the input or output doesn't contain
- 1699 problematic content or if the developers just forgot to include a warning.

1700

1744  
1745  
1746  
1747  
1748  
1749  
1750

- **Points:**
  - 0: The benchmark does not mention that they checked for the presence or absence of sensitive/harmful content in the evaluation tasks or expected output.
  - 5: The benchmark mentions the general possibility of sensitive/harmful content but does not provide clear statements or warnings.
  - 10: The benchmark explicitly states the presence or absence of sensitive/harmful content for either the evaluation tasks or the expected output.
  - 15: The benchmark explicitly states the presence or absence of sensitive/harmful content for both the evaluation tasks and the expected output.

## 9. Release requirements specified

- **Explanation:** Benchmark developers specify rules for benchmark users to “ensure the integrity of test results” [82]. While not all benchmark developers will be able to enforce the release requirements, they should at least specify them. One example is: “1. Publishers do not train directly on or against the benchmark dataset and retract any reported results if and when benchmark data is found to have been in training data. 2. Techniques that are likely to increase the test performance without a commensurate increase in safety factor are discouraged and may result in benchmark exclusion. [...]” [82]
- **Justification:** Written terms of use can help to set expectations and have a foundation to address subsequent contamination or intentional gamification attempts of the benchmark. Potential options they could mention in case of release requirement breaches are, e.g., “publishing public statements correcting the public record” or “resulting in the [model] being permanently banned from the benchmark” [82]; however, we will not assess the enforcement ability or potential listed sanctions as part of this criteria, just the statement of release requirements.
- **Points:**
  - 0: The benchmark does not specify any release requirements for benchmark users.
  - 5: The benchmark briefly mentions the issue of potential gameability or misuse by benchmark users but does not provide specific details.
  - 10: The benchmark states dos and donts how to use the benchmark but does not specify these as requirements for use.
  - 15: The benchmark provides a set of release requirements for benchmark users.

## 10. Includes *Build Status* or equivalent

- **Explanation:** A build status is a feature, typically implemented as a GitHub Action, that indicates whether the most recent build of the benchmark was successful [28]. It should be implemented for the benchmark’s evaluation code. It verifies that the code is running correctly after the latest commit.
- **Justification:** A passing build status signifies that the main evaluation code was usable at the latest commit [28]. Including a build status or equivalent can help to ensure the reliability and usability of the evaluation code. It allows benchmark users to quickly determine if the code is functioning as intended, saving time and effort in identifying potential issues.
- **Points:**
  - 0: The benchmark neither references nor implements any form of build status or equivalent.
  - 5: The benchmark mentions the need for working evaluation code but does not implement it in any meaningful way.
  - 10: The benchmark partially implements a build status or equivalent by providing the information in a less accessible manner.
  - 15: The benchmark fully implements a build status or equivalent, clearly displaying the status of the most recent build and providing easy access to the information.

## 1751 **K.3 Benchmark Documentation**

### 1752 **1. Requirements file available**

- 1753 • **Explanation:** A requirements or environment file, or equivalent is available.
- 1754 • **Justification:** Ease of use is a key criteria for benchmark adoption. Providing a
- 1755 requirements file allows for the quick installation of relevant packages at the correct
- 1756 versions, e.g., within a virtual environment, to use the evaluation code.
- 1757 • **Points:**
  - 1758 – 0: No requirements file or equivalent is provided.
  - 1759 – 5: A requirements file is mentioned but not provided.
  - 1760 – 10: A requirements file is provided but may be missing some dependencies or
  - 1761 versions.
  - 1762 – 15: A complete and accurate requirements file specifying all necessary dependen-
  - 1763 cies and versions is provided.

### 1764 **2. Quick-start guide or demo code available**

- 1765 • **Explanation:** The benchmark developers make a quick start guide or demo available
- 1766 that walks step-by-step through how the benchmark can be used.
- 1767 • **Justification:** Similar to the criteria above, ease of use is a key criteria for benchmark
- 1768 adoption. Providing a quick-start guide takes away any guesswork on the user side and
- 1769 allows them to directly set up and use the benchmark without spending extra time on
- 1770 setup issues.
- 1771 • **Points:**
  - 1772 – 0: No quick-start guide or demo code is provided.
  - 1773 – 5: A quick-start guide or demo code is mentioned but not provided.
  - 1774 – 10: A quick-start guide or demo code is provided but may be missing some steps or
  - 1775 details.
  - 1776 – 15: A comprehensive, step-by-step quick-start guide or demo code is provided.

### 1777 **3. Includes informative In-line code comments**

- 1778 • **Explanation:** In-line code comments state the purpose, inputs, outputs, and functional-
- 1779 ity of each code segment in all files relevant for the benchmark evaluation.
- 1780 • **Justification:** In-line documentation of code enhances clarity, understanding, and
- 1781 reproducibility. It facilitates collaboration, maintainability, and makes debugging easier
- 1782 for benchmark developers and users, should that be necessary.
- 1783 • **Points:**
  - 1784 – 0: No in-line code comments are provided.
  - 1785 – 5: In-line code comments are sparse and do not adequately explain the purpose,
  - 1786 inputs, outputs, or functionality of the code.
  - 1787 – 10: Informative in-line code comments are present for most of the code but may be
  - 1788 lacking in detail or clarity for some code segments.
  - 1789 – 15: Comprehensive and informative in-line code comments are provided for all
  - 1790 relevant code segments, clearly explaining their purpose, inputs, outputs, and
  - 1791 functionality.

### 1792 **4. Code documentation available**

- 1793 • **Explanation:** A full documentation of the repository and code it entails is publicly
- 1794 available. This includes, for example, an overview of the folder structure, the files in
- 1795 the repo, an explanation of functions in the repo.
- 1796 • **Justification:** Detailed documentation of code enhances clarity, understanding, and
- 1797 reproducibility. It facilitates collaboration, maintainability, and makes debugging easier
- 1798 for benchmark developers and users, should that be necessary.
- 1799 • **Points:**

- 1800 – 0: No code documentation is provided.
- 1801 – 5: Code documentation is mentioned but not provided.
- 1802 – 10: Code documentation is minimal or incomplete, lacking important details about
- 1803 the repository structure and functions.
- 1804 – 15: Comprehensive code documentation is provided, including a clear overview
- 1805 of the folder structure, files in the repo, and detailed explanations of all relevant
- 1806 functions.

## 1807 5. Documentation of test task categories & rationale

- 1808 • **Explanation:** The benchmark developers define the tasks or task categories a model
- 1809 is tested on and describe the rationale for choosing the tasks or task categories. The
- 1810 rationale should explain how these tasks are relevant to the benchmark’s objectives,
- 1811 what they aim to measure, and why they are important for evaluating the concept or
- 1812 capability to be tested.
- 1813 • **Justification:** Documenting test tasks is essential for transparency and for allowing
- 1814 public scrutiny of the benchmark. The rationale provides insight into the selection
- 1815 process, demonstrating that the tasks are not arbitrary but are carefully chosen to reflect
- 1816 real-world applications and user needs. Both help users decide if the benchmark is
- 1817 adequate for their evaluation contexts.
- 1818 • **Points:**
- 1819 – 0: No documentation of test task categories or rationale is provided.
- 1820 – 5: Test task categories are mentioned but they are neither defined in detail and a
- 1821 rationale for their selection is missing or inadequate.
- 1822 – 10: Test task categories are defined, but the rationale for their selection is not
- 1823 provided.
- 1824 – 15: Test task categories are clearly defined, and a comprehensive rationale is
- 1825 provided, explaining their relevance to the benchmark’s objectives, what they
- 1826 measure, and their importance for evaluating the targeted concept or capability.

## 1827 6. Documentation of assumptions about normative properties

- 1828 • **Explanation:** If the benchmark measures properties that vary across cultural contexts
- 1829 (e.g., politeness), then normative assumptions are explicitly stated. The benchmark
- 1830 developers clearly define the cultural context and values that the benchmark adheres to,
- 1831 explaining how the measured properties are conceptualized and operationalized within
- 1832 the benchmark.
- 1833 • **Justification:** By explicitly stating normative assumptions, the authors provide trans-
- 1834 parency about the cultural framework and values that guide the benchmark’s design
- 1835 and evaluation criteria, which can subsequently ensure cultural sensitivity and mitigate
- 1836 potential biases. It also facilitates informed decision-making for users of benchmarks,
- 1837 specifically for culture-dependent use cases they’re interested in, such as measuring
- 1838 toxicity or bias, for example.
- 1839 • **Points:**
- 1840 – 0: No documentation of normative assumptions is provided, even though the
- 1841 benchmark measures culturally-dependent properties.
- 1842 – 5: The potential influence and importance of cultural context on the benchmark is
- 1843 acknowledged but normative assumptions aren’t stated.
- 1844 – 10: Normative assumptions are stated, but the explanation of how they are concep-
- 1845 tualized and operationalized within the benchmark is incomplete or lacks clarity.
- 1846 – 15: Normative assumptions are explicitly and clearly stated, defining the cultural
- 1847 context and values that the benchmark adheres to, and explaining how the measured
- 1848 properties are conceptualized and operationalized within the benchmark.

## 1849 7. Documentation of limitations

- 1850 • **Explanation:** Benchmark developers outline the limitations of the benchmark, includ-  
1851 ing but not limited to the tasks, contexts, and scenarios that are not covered by the  
1852 evaluation are acknowledged. It's stated which use cases are out-of-scope.
- 1853 • **Justification:** Documenting a benchmark's limitations is necessary for users to assess  
1854 its suitability for their specific evaluation needs. By understanding what the benchmark  
1855 does not cover, users can make informed decisions about whether the benchmark  
1856 aligns with their goals and whether additional evaluations (either in the form of other  
1857 benchmarks or private evaluations) may be required to complement the benchmark's  
1858 results.
- 1859 • **Points:**
  - 1860 – 0: No documentation of the benchmark's limitations is provided.
  - 1861 – 5: Limitations of AI evaluations more broadly are briefly mentioned but without  
1862 any detail and not applied to the specific benchmark.
  - 1863 – 10: Either limitations regarding the applicability and use of the benchmark or  
1864 limitations of the benchmark design are discussed, but not both.
  - 1865 – 15: Both limitations regarding the applicability and use of the benchmark and  
1866 limitations of the benchmark design are comprehensively discussed.

## 1867 8. Documentation of benchmark construction process

- 1868 • **Explanation:** Benchmark developers give a detailed account of the design process,  
1869 including the specific decisions made at each lifecycle stage, the rationale behind  
1870 them, and any trade-offs or compromises (e.g., balancing complexity vs. practicality)  
1871 considered.
- 1872 • **Justification:** Documenting the benchmark design process is essential for transparency,  
1873 as it allows users to understand how the benchmark was created and what factors  
1874 influenced its development. It allows users to assess the thoroughness and rigor of the  
1875 benchmark's construction. This information further enables users to critically evaluate  
1876 whether the benchmark is suitable for their specific use case.
- 1877 • **Points:**
  - 1878 – 0: No documentation of the benchmark construction process is provided.
  - 1879 – 5: The benchmark construction process is briefly mentioned but lacks sufficient  
1880 detail about the decisions made, rationale, and trade-offs considered.
  - 1881 – 10: The benchmark construction process is documented, including some decisions  
1882 made and their rationale, but the description lacks depth or fails to address important  
1883 aspects such as trade-offs or compromises.
  - 1884 – 15: The benchmark construction process is comprehensively documented, providing  
1885 a detailed account of the specific decisions made at each stage, the rationale behind  
1886 them, and any trade-offs or compromises considered.

## 1887 9. Provision of a globally unique, persistent identifier for a dataset and its metadata

- 1888 • **Explanation:** The benchmark dataset and its associated metadata are assigned a  
1889 globally unique and persistent identifier, such as a Digital Object Identifier (DOI), to  
1890 ensure long-term accessibility and citability of the resource (FAIR Principles, 2024).
- 1891 • **Justification:** A persistent identifier supports the findability and accessibility of the  
1892 benchmark and its dataset. It allows for unambiguous referencing of the data, facilitates  
1893 proper attribution, and ensures that the dataset can be located and accessed over time,  
1894 even if its physical location changes. This practice aligns with the FAIR (Findable,  
1895 Accessible, Interoperable, Reusable) principles, enhancing the benchmark's scientific  
1896 value and reusability.
- 1897 • **Points:**
  - 1898 – 0: The benchmark paper, dataset, and metadata are not assigned any persistent  
1899 identifier.

- 1900 – 5: The benchmark assigns persistent identifiers to the paper, the dataset, or the
- 1901 metadata.
- 1902 – 10: The benchmark assigns a persistent identifier to two out of three (paper, dataset,
- 1903 metadata).
- 1904 – 15: The benchmark assigns a globally unique, persistent identifier to the dataset, its
- 1905 metadata, and the paper.

#### 10. Inclusion of standardized metadata (e.g., following the Croissant standard)

- 1907 • **Explanation:** The benchmark includes comprehensive, standardized metadata that
- 1908 describes the dataset, its structure, and relevant information about its creation and usage.
- 1909 This metadata adheres to established standards such as the Croissant standard, which is
- 1910 designed specifically for machine learning datasets.
- 1911 • **Justification:** Standardized metadata is crucial for ensuring interoperability and
- 1912 reusability of the benchmark dataset. It provides consistent and machine-readable
- 1913 information about the dataset’s contents, structure, and provenance. This standard-
- 1914 ization facilitates easier discovery, understanding, and integration of the dataset into
- 1915 various research workflows. By following established standards like Croissant, the
- 1916 benchmark enhances its utility across different platforms and tools in the machine
- 1917 learning ecosystem.
- 1918 • **Points:**
- 1919 – 0: The benchmark does not include any structured metadata.
- 1920 – 5: The benchmark includes some basic metadata, but it is not standardized or
- 1921 comprehensive.
- 1922 – 10: The benchmark includes comprehensive metadata that covers most aspects of
- 1923 the dataset, but it does not fully adhere to a recognized standard like Croissant.
- 1924 – 15: The benchmark includes complete, standardized metadata (e.g., following the
- 1925 Croissant standard) that thoroughly describes all aspects of the dataset, ensuring
- 1926 maximum interoperability and reusability.

#### 11. Documentation of data sources and how the data was collected (if applicable)

- 1928 • **Explanation:** The benchmark provides comprehensive documentation detailing the
- 1929 origins of the data, the methods used for data collection, and, where applicable, dis-
- 1930 cusses issues of data provenance and informed consent. They also list the license types
- 1931 for all data used and how they ensured compliance with that license.
- 1932 • **Justification:** Thorough documentation of data sources and collection methods is
- 1933 necessary for ensuring transparency, reproducibility, and ethical design of the bench-
- 1934 mark. It allows users to understand the context and limitations of the data, assess its
- 1935 appropriateness for their specific use cases, and make informed decisions about its
- 1936 application. Furthermore, discussing data provenance and informed consent addresses
- 1937 ethical considerations, particularly when dealing with sensitive or personal data, and
- 1938 helps ensure compliance with data protection regulations.
- 1939 • **Points:**
- 1940 – 0: The benchmark provides no information about data sources or collection meth-
- 1941 ods.
- 1942 – 5: The benchmark mentions data sources but provides minimal details about
- 1943 collection methods or ethical considerations.
- 1944 – 10: The benchmark includes a detailed description of data sources and collection
- 1945 methods, but lacks a discussion of data provenance, compliance with licensing, or
- 1946 informed consent, where applicable.
- 1947 – 15: The benchmark provides extensive documentation of data sources, collection
- 1948 methods, and a thorough discussion of data provenance, compliance with licensing,
- 1949 and informed consent, addressing relevant ethical and legal considerations.

#### 12. Documentation of the data preprocessing steps taken

1950

- 1951 • **Explanation:** The benchmark provides a detailed account of all preprocessing steps
- 1952 applied to the raw data before its inclusion in the final dataset. This documentation
- 1953 includes information on data cleaning, normalization, feature engineering, handling
- 1954 of missing values, and any other transformations or manipulations performed on the
- 1955 original data. If no data preprocessing was done, the authors state this explicitly.
- 1956 • **Justification:** Thorough documentation of preprocessing steps is necessary for ensur-
- 1957 ing reproducibility and transparency of the benchmark. It allows users to understand
- 1958 exactly how the final dataset was created, which is key for interpreting results, repli-
- 1959 cating experiments, and assessing the benchmark’s applicability to different use cases.
- 1960 Additionally, this information helps identify potential biases or artifacts introduced
- 1961 during preprocessing that could affect model performance or generalization.
- 1962 • **Points:**
- 1963 – 0: The benchmark provides no information about data preprocessing steps.
- 1964 – 5: The benchmark mentions that preprocessing was done but offers minimal details
- 1965 about the specific steps taken.
- 1966 – 10: The benchmark includes a general description of preprocessing steps, but lacks
- 1967 comprehensive details or fails to cover all aspects of the data preparation process.
- 1968 – 15: The benchmark provides an exhaustive, step-by-step documentation of all
- 1969 preprocessing procedures, including rationales for choices made and potential
- 1970 impacts on the data.

### 1971 13. Documentation of the data annotation process (if applicable)

- 1972 • **Explanation:** The benchmark provides documentation of the data annotation process,
- 1973 including the annotation guidelines, the qualifications and training of annotators, the
- 1974 annotation tools used, quality control measures, and inter-annotator agreement metrics.
- 1975 This documentation covers the entire workflow from raw data to the final annotated
- 1976 dataset.
- 1977 • **Justification:** Comprehensive documentation of the annotation process is necessary for
- 1978 understanding the quality, reliability, and potential biases in the labeled data. It allows
- 1979 users to assess the suitability of the dataset for their specific tasks and to interpret results
- 1980 accurately. Transparent annotation documentation also enables reproducibility of the
- 1981 labeling process, facilitates improvements in future iterations of the benchmark, and
- 1982 helps in identifying and mitigating potential sources of bias or error in the annotations.
- 1983 • **Points:**
- 1984 – 0: The benchmark provides no information about the data annotation process.
- 1985 – 5: The benchmark mentions that data was annotated but offers minimal details
- 1986 about the process or guidelines used.
- 1987 – 10: The benchmark includes a general description of the annotation process, includ-
- 1988 ing guidelines and tools used, but lacks comprehensive details on quality control
- 1989 measures or inter-annotator agreement.
- 1990 – 15: The benchmark provides exhaustive documentation of the entire annotation pro-
- 1991 cess, including detailed guidelines, annotator information, quality control measures,
- 1992 inter-annotator agreement metrics, and discussions of potential biases or limitations
- 1993 in the annotation approach.

### 1994 14. Documentation of the representativeness of the data (if applicable)

- 1995 • **Explanation:** The benchmark provides analysis and documentation of how representa-
- 1996 tive the dataset or environment is of the target population or domain. This includes an
- 1997 explanation of the sampling procedure used, any potential biases in the data collection
- 1998 process, and how well the dataset captures the diversity and distribution of the intended
- 1999 population or phenomenon being studied.
- 2000 • **Justification:** Understanding the representativeness of the data is necessary for assess-
- 2001 ing the generalizability and validity of any conclusions drawn from models trained

2002  
2003  
2004

or evaluated on the benchmark. It helps users identify potential limitations or biases in the dataset that could affect model performance in real-world applications. Proper documentation of representativeness also aids in interpreting benchmark results within the context of the population it represents and highlights areas where the dataset may need expansion or improvement to better cover underrepresented groups or scenarios.

- **Points:**

- 0: The benchmark provides no information about the representativeness of the data or the sampling procedure used.
- 5: The benchmark mentions the importance of data representativeness but offers minimal analysis or explanation of how representative the dataset actually is.
- 10: The benchmark includes a general discussion of data representativeness and the sampling procedure, but lacks comprehensive analysis or fails to address potential biases or limitations in representativeness.
- 15: The benchmark provides an in-depth analysis of data representativeness, including detailed explanation of the sampling procedure, quantitative measures of population coverage, discussion of potential biases, and acknowledgment of any limitations in representativeness.

## 15. Standardized documentation

- **Explanation:** The benchmark utilizes a standardized documentation format, such as data cards, to present the information about the dataset that is underlying to the benchmark. This standardized approach ensures that all key aspects of the dataset are systematically covered, including its composition, collection methodology, intended uses, ethical considerations, and potential biases.

- **Justification:** Adopting a standardized documentation scheme like data cards enhances the usability and transparency of the benchmark. It provides a consistent, structured format that makes it easier for users to quickly understand the dataset’s characteristics, limitations, and appropriate use cases. Standardized documentation facilitates easier comparison between datasets and benchmarks, promotes best practices in data reporting, and helps identify potential issues or gaps in the dataset’s coverage.

- **Points:**

- 0: The benchmark does not use any standardized documentation scheme.
- 5: The benchmark includes some elements of standardized documentation, but does not fully adhere to an established scheme like data cards.
- 10: The benchmark uses a standardized documentation scheme, but some sections are incomplete or lack detail.
- 15: The benchmark fully implements a comprehensive standardized documentation scheme (e.g., data cards), providing thorough and structured information on all relevant aspects of the dataset.

## 16. Documentation of evaluation metric(s)

- **Explanation:** The evaluation metrics used are clearly specified and defined, both for standard and custom metrics tailored to the specific task or domain. The exact formulas or processes used to calculate these metrics, along with any parameters or thresholds employed, are made transparent.

- **Justification:** Documenting the evaluation metrics and scoring process is essential for enabling users to understand how the benchmark quantifies model performance and determines rankings or comparisons. By providing clear and detailed information about the metrics and scoring methods, users can assess whether the chosen metrics are appropriate for the task at hand, align with their own evaluation criteria, and provide a fair and meaningful basis for comparing different models or approaches.

- **Points:**

- 0: No documentation of the evaluation metrics is provided.

- 2053 – 5: The evaluation metrics are mentioned but not clearly defined, and the exact  
2054 formulas or processes used to calculate them are not provided.  
2055 – 10: The evaluation metrics are defined, but the documentation lacks some important  
2056 details, such as any parameters or thresholds employed.  
2057 – 15: The evaluation metrics are clearly specified. The exact formulas or processes  
2058 used to calculate these metrics, along with any parameters or thresholds employed,  
2059 are comprehensively documented.

#### 2060 17. Report statistical significance of benchmark results for at least one model

- 2061 • **Explanation:** Benchmark developers run statistical significance tests on the benchmark  
2062 results. They report results for, e.g., more than one random seed, and provide variance  
2063 bounds. In cases where the benchmark is perfectly deterministic, this should be  
2064 explicitly stated.  
2065 • **Justification:** Not doing statistical significance testing can significantly reduce the  
2066 validity, utility and confidence in results [13]. Especially for benchmarks, we want to  
2067 understand how much of the results are due to noise and how much is caused by true  
2068 differences between the models tested.  
2069 • **Points:**  
2070 – 0: No statistical significance testing or variance reporting is provided for the  
2071 benchmark results.  
2072 – 5: The need for valid benchmarks and/or statistical significance or uncertainty  
2073 estimation is mentioned but not addressed.  
2074 – 10: Benchmark developers if “bound the expected variation across model training  
2075 runs” [40], [13]  
2076 – 15: Benchmark developers run statistical significance tests on the benchmark results  
2077 for at least one model and provide variance bounds or other uncertainty estimations.  
2078 In cases where the benchmark is perfectly deterministic, this is explicitly stated.

#### 2079 18. Accepted at peer-reviewed venue

- 2080 • **Explanation:** The benchmark/its associated paper was accepted to a peer-reviewed  
2081 journal, conference, or similar venue.  
2082 • **Justification:** Acceptance at a peer-reviewed venue signifies that the benchmark  
2083 has undergone an evaluation by an external party, ensuring its validity, reliability, and  
2084 scientific merit [5]. This peer review process contributes to the credibility and assurance  
2085 to users that the benchmark meets established standards of quality and relevance [5].  
2086 • **Points:**  
2087 – 0: The benchmark/its associated paper has not been accepted at a peer-reviewed  
2088 venue.  
2089 – 5: The benchmark/its associated paper has been submitted to a peer-reviewed venue  
2090 but is still under review or awaiting acceptance.  
2091 – 10: The benchmark/its associated paper has been accepted at a peer-reviewed  
2092 workshop or symposium.  
2093 – 15: The benchmark/its associated paper has been accepted at a peer-reviewed  
2094 journal, conference, or similar high-profile venue.

#### 2095 19. Specifies applicable license

- 2096 • **Explanation:** The benchmark developers clearly specify the applicable license for the  
2097 benchmark in the code repository or paper. This includes providing information about  
2098 the conditions under which the benchmark can be used, modified, and distributed.  
2099 • **Justification:** Specifying the applicable license ensures legal clarity and compliance  
2100 for benchmark users and enables wider adoption, as commercial users might not be  
2101 able to use the benchmark if no license is specified.  
2102 • **Points:**

- 2103 – 0: No license is specified for the benchmark.
- 2104 – 5: A license is mentioned but not clearly specified or linked to in the code repository
- 2105 or paper.
- 2106 – 10: A license is specified but lacks some important details about the conditions
- 2107 under which the benchmark can be used, modified, or distributed.
- 2108 – 15: The applicable license for the benchmark is clearly specified in the code
- 2109 repository or paper, providing comprehensive information about the conditions
- 2110 under which the benchmark can be used, modified, and distributed.

## 2111 **K.4 Benchmark Maintenance**

### 2112 **1. Code usability checked within the last year**

- 2113 • **Explanation:** The main files of the public code were updated within the last year<sup>8</sup>, or
- 2114 the developers checked that the benchmark code is still usable and explicitly state this
- 2115 check in the README file, including the date of the check.
- 2116 • **Justification:** Over time, packages that the benchmark depends on may be updated and
- 2117 become incompatible with the original evaluation/benchmark code. To ensure ongoing
- 2118 usability, benchmark developers must check if their code can still be used at least once
- 2119 a year<sup>9</sup>. This practice ensures that users can use the benchmark without encountering
- 2120 and having to fix issues due to outdated dependencies.
- 2121 • **Points:**
- 2122 – 0: No updates to the main files of the public code within the last year, and no
- 2123 explicit statement of a usability check in the README file.
- 2124 – 5: Updates to minor files in the repo were made (e.g., README file) but an explicit
- 2125 statement of a usability check in the README file is not reported.
- 2126 – 10: Updates to the main files of the public code were made within the last year, but
- 2127 the build status check failed and wasn't fixed.
- 2128 – 15: Updates to the main files of the public code within the last year, accompanied
- 2129 by a successful build status check, or an explicit statement of a usability check in
- 2130 the README file, including the date of the check was provided.

### 2131 **2. Maintained feedback channel for users**

- 2132 • **Explanation:** GitHub issues are acknowledged or addressed within three months. If
- 2133 there are no open issues, benchmark developers would get full points.
- 2134 • **Justification:** Over time, users may find issues with the benchmark tasks or imple-
- 2135 mentation. To ensure continued usability, benchmark developers should address these
- 2136 concerns in a reasonable amount of time. Promptly responding to user feedback helps
- 2137 maintain the reliability and relevance of the benchmark.
- 2138 • **Points:**
- 2139 – 0: No acknowledgment or response to GitHub issues that are older than three
- 2140 months<sup>10</sup>.
- 2141 – 5: GitHub issues are mentioned as a way to provide feedback but there are GitHub
- 2142 issues that were not responded to and that are older than three months.
- 2143 – 10: All GitHub issues are acknowledged within three months, but not all are
- 2144 addressed or resolved or were closed because the issue/feature request won't be
- 2145 attended to.

<sup>8</sup>We recognize that this criterion is just a proxy for checking code usability, but we assume that if the main code was edited and a build status [28] passed, that the usability was sufficiently checked.

<sup>9</sup>The one-year threshold is somewhat arbitrary but out of experience of the authors, there is some transition period until which old versions can still be reliably used and are maintained, which can vary from a few months to a few years.

<sup>10</sup>This is an arbitrary cut-off time but it seemed reasonable to give developers extended time to respond to open issues.

2146 – 15: All GitHub issues are acknowledged and addressed within three months, or it is  
2147 clearly stated if an issue cannot be fixed or if a feature request won't be fulfilled.  
2148 Alternatively, there are no open issues<sup>11</sup>.

2149 **3. Provide contact details of person responsible for benchmark**

2150 • **Explanation:** The benchmark should include contact details of the person responsible,  
2151 such as a corresponding author in the associated paper, a contact person listed on  
2152 GitHub or the website, or an available online feedback form.

2153 • **Justification:** Providing contact details ensures that users have a communication  
2154 channel for inquiries, feedback, or reporting issues related to the benchmark. This  
2155 transparency supports effective collaboration and resolution of problems, enhancing  
2156 the benchmark's usability.

2157 • **Points:**

2158 – 0: It is not disclosed who developed the benchmark.

2159 – 5: The benchmark developers are disclosed but no explicit contact details are  
2160 provided.

2161 – 10: Contact details are provided but are incomplete or difficult to find, e.g., only as  
2162 part of terms of service on a website.

2163 – 15: Contact details of the person responsible for the benchmark are easily accessible,  
2164 such as a corresponding author in the associated paper, a contact person listed on  
2165 GitHub or the website, or an available online feedback form.

---

<sup>11</sup>This is an imperfect proxy for a maintained feedback channel. It may be that the benchmark is working well or it may be that the benchmark is not used enough for issues to occur. However, maintenance is a critical part of benchmarks, and we hence decided to include an imperfect proxy rather than not including this criterion at all.
